1) EXECUTIVE SUMMARY

1.1 Background

The Town of Keene, herein known as the Town, is located in the heart of the Adirondack Mountains. The Hamlet of Keene Valley (within the Town of Keene) is located on Route 73, about ten miles west of Interstate 87, Exit 30.

The original water system in Keene Valley started as a privately-owned water system when it was constructed in the early **1990's**. The system was sold by the Keene Valley Water Company to the Town of Keene as Water District #2, on December 28, 1955. Slide Brook was used as the original water supply (an untreated surface water source) for the water system. In 1998, the Water District completed the construction of two groundwater productions wells, a control **building and chlorination facility with emergency generator backup and an 8**" ductile iron water transmission main from the control building located (on Trails End Road) to and along Interbrook Lane to the original water storage reservoir north of Interbrook Lane.

A 2005 engineering report, "Engineering Report of Findings for the Town of Keene Waste District #2 Water System Improvements, prepared by AES Northeast, February 4, 2005, outlined several deficiencies that remained in the water system after the 1998 upgrades. These included:

- The replacement of the majority of the distribution system and laterals as these were found to be either leaking, of poor material quality, shallowly buried, undersized, or some combination of all four.
- Replacement of the water storage reservoir located on Interbrook Lane (west of Route 73) with a new storage tank.
- Replacement of a failing 1998 well.
- Miscellaneous upgrades to the well control building.

In in 2009-2010 a capital project completed the first two bullet points and part of the work at the well control building. The failed well was not replaced.

In 2019 an emergency project was implemented to replace the failed well with a new well.

In 2020, leaks at the Town's water storage tank were repaired.

The Town's remaining 1998 well is now nearing failure and requires replacement, it is currently out of service.

The Town's water storage tank is lacking outfall dechlorination and an internal mixer.

The Town's well control building requires repairs or replacement in addition to those that remain from the original reporting, mainly due to the age of the system.

The Town's system does not have water meters. Water meters are generally required for water systems.

The Town is looking to install a new Hiker's Center. The Center will require a water service.

1.2 Purpose

The goal of this report is to provide a review of the Town's water treatment and supply system and provide general recommendations for upgrades. Alternatives for replacement or repair of the well field control building as well as recommendations for replacing the failing well, upgrades to the water storage tank, addition of water meters and connection to a new hiking center are presented for consideration by the Town. This report is intended to be a preliminary engineering evaluation sufficient to begin pursing funding. Additional evaluations and reporting will be

required once a suitable replacement well is located and to provide the final scope of work based on the available funding.

1.3 Evaluations Conducted

AES Northeast gathered existing mapping, reviewed existing hydrogeological reports, and reviewed previous report data in order to provide recommendations for upgrades to the water system.

1.4 <u>Recommendations</u>

Three alternatives were evaluated to determine if they met the requirements of the Town. The three alternatives include replacement of the well field control building, repair of the well field control building, and a no action alternative. It is recommended that the replacement well field control building along with the replacement mechanically redundant well, installation of water meters, and the alternates (as funds allow) be pursued as a project.

2) PROJECT BACKGROUND & HISTORY

2.1 <u>Relevant Documentation, Previous Reports, Local Planning Documents, Jurisdictional</u> <u>Permitting Agencies, and Regulatory Design Manuals.</u>

2.1.1 Relevant Documentation

The following documents have been included for easy reference.

Well History Documentation.

- 2019-10-07 HydroSource Associates Preliminary Report Proposed Backup Well Source
- 2019-03-12 HydroSource Associates Final Report Proposed New Groundwater Source

Refer to Appendix A: Relevant Documentation.

2.1.2 Previous Reports

The following reports were reviewed in preparation of this report.

- Report of Findings for the Feasibility of Reducing Pressure for the Town of Keene, Hamlet of Keene Valley, Water District No. 2 September 10, 2003, AES Northeast, PLLC, Project No. 2682
 - The purpose of this project is to propose the replacement of **the "old" water distribution system and** the installation of a new aboveground water storage tank.
- Report of Findings for the Feasibility of Reducing Pressure for the Town of Keene, Hamlet of Keene Valley, Water District No. 2 February 4, 2005, AES Northeast, PLLC, Project No. 2682
 - This report is an update for funding purposes of the 2003 report.
- Town of Keene Water District #2 Well System Upgrades Map, Plan, and Report July 24, 2019, AES Northeast, PLLC, Project No. 4782
 - The purpose of this report is to summarize the improvements and work needed to be completed under the 2019 emergency conditions to obtain funding.

2.1.3 Local Planning Documents

a. "Town of Keene Master Plan"

"Site Plan Review Law" As Amended and Enacted by the Town of Keene, November 12, 2003, In Accord with Town of Keene Master Plan of the Keene Planning Board.

2.1.4 Regulatory Design Manuals

a. <u>"State of New York Unofficial Compilation of Codes, Rules and Regulations"</u>

"Title 10. Department of health Chapter 1. State Sanitary Code Part 5. Drinking Water Supplies Subpart 5-1. Public Water Systems." – latest edition.

b. "10 States Standards"

Great Lakes – Upper Mississippi River Board of State and Provincial Public Health and Environmental Managers, **"Recommended Standards for Wa**ter Works," latest edition.

2.2 <u>Site Information</u>

2.2.1 Location

The water system serving the Hamlet of Keene Valley is located at the south edge of the school athletic fields on Trail's End Road in Keene Valley, New York.

Refer to Figure 2.1: General Location Map.

Refer to Figure 2.1.1: Project Location Map.

2.2.2 Land Use

a. State Conservation Areas - Wild Forests and Wilderness Areas

All land, both public and private, within the Adirondack Park has been designated a land use classification by the APA. The land use classification sets restrictions on land use and development and establishes setbacks from natural resources. The purpose of the APA land use classifications is to balance private ownership and economic growth and development with maintaining the natural character of the Adirondack Park. The treatment facilities are located within a Hamlet. (*APA River Corridors – August 20, 2013*)

Refer to Figure 2.2: APA Land Use Designations.

b. Scenic Byways

New York State and the federal government both have programs that identify historically and visually significant highways and manage projects in and around these highways to avoid disturbing aesthetics of the areas around the highways. Designated highways are known as Scenic Byways. NYSDOT is the agency responsible for managing this program. A review of the list of NYS Scenic Byways reveals that the scope of the project will have no effect on scenic byways.

Refer to Figure 2.3: NYSDOT Scenic Byway.

c. <u>Zoning</u>

The Town does not have zoning documents available for review. The Town does have an applicable Site Plan Review Law in place where its goal is "A clean, wholesome, attractive community..." focused on "...the natural and scenic qualities..." of the Town.

The project site is within the existing Hamlet boundaries outlined by the APA.

Refer to Appendix B: APA Shoreline Restrictions.

d. Agricultural and Industrial Land Use Activities

The project scope does not include or impact any agricultural or industrial land use activities.

2.2.3 Geologic Conditions

a. <u>Topography</u>

The land that the WTP is located on very flat site in a natural valley between the local mountains in Keene.

Refer to Figure 2.4: Town of Keene Topography.

Refer to Figure 2.4.1: *Project Site Topography*.

b. <u>Soils</u>

With regards to both site locations, the various soils found within their parcel boundaries are as follows: FnD-Fernlake Loamy fine sand at the water tower storage site. RyA-Rumney-Burnt, TuD-Turnbridge-Lymen 35% and 70% slopes, PoA-Podunk Very fine sand, ChE and ChB-Champlain loamy sand, CsB-Colton very gravelly sand, and NaA-Naumberg loamy fine sand. Since a majority of the soils are loamy sand or boulder type sands, both sites have well to moderate drainage with mixed drainage near areas of wetland delineation due to the shallow restrictive layer raising the water table up and inundating the soils. Combined with deep restrictive layers, this allows much of the drained groundwater to seep deep into the soil, with only the south western portion of the Keene School parcel having high water table depths due to the natural wetland inundating the soils near the more shallow restrictive layers in that area.

Refer to Figure 2.5: USDA Soil Map.

Refer to Figure 2.5.1: USDA Hydrologic Soil Map.

Refer to Figure 2.5.2: USDA Restrictive Layer Map.

Refer to Figure 2.5.3: USDA Depth to Water Table.

2.2.4 Subsurface Water Features

a. Water Supply Source

Currently, the Town sources water from wells located on the site of the well control building. There are two current wells, Well #1 and the newly installed Well #3. Well #2 was abandoned in 2019 and Well #1 is effectively offline and no longer usable as its production has declined over time although it is still connected to the system.

Well #1 is 270 ft bedrock well has previously shown to have a sustainable yield of approximately 200 gpm. Well #2, now disconnected from service, had a sustainable yield of approximately 150 GPM. Well #3 is a 150 ft gravel-pack well and pump tests indicate that 300 gpm is a sustainable yield for this well.

The water supplied by both Well #1, Well #2 and Well #3 have historically been of good quality.

2.2.5 Environmental Resources

a. <u>Wetlands</u>

The Adirondack Park Agency mapping of wetlands is usually the most comprehensive source of wetland mapping within the Park; however, the wetland mapping does not delineate wetlands within the planning area. Wetlands under 1 acre may not be jurisdictional by the APA, however the ACOE may take jurisdiction if any work disturbs the certain regulated wetlands (even temporarily).

Refer to Figure 2.6: APA & DEC Wetland Map.

b. Endangered Species

Both the New York Department of Environmental Conservation (NYSDEC) and United States Fish & Wildlife Service (USFWS) online databases were utilized to determine the presence of potential endangered species in the project planning area. The NYSDEC mapper showed that there is a presence of an endangered species. From the USFWS resource search indicated that the Indiana Bat and the Northern Long-Eared Bat have the potential to be impacted. However, within the scope of the project there is little chance for the species to be affected as the project site is mostly open field.

Working in areas that may impact the Indiana Bat places requirements related to tree cutting. Tree cutting is generally restricted to November 1st to March 31st, or if cutting must occur outside of those months, then biologists must be called in to determine if there will be any impacts to the bat. Previous work done on site shows a developed area for renovation and construction. The Northern Long-Eared Bat is federally listed as a threatened species. Both bats typically hibernate in caves/mines in the winter and roost in trees in the summer. Similar precautions should be taken to protect both species, although the requirements for protection of the Indiana Bat are more stringent based on its classification as Endangered.

There have been fourteen known species of migratory birds observed in the area. In the scope of the project it is unlikely that any harm will come to the birds as the site is relatively developed and the proposed work should not affect the migratory bird population.

Refer to Appendix C: Environmental Fact Sheets & Resources.

2.2.6 Floodplain Considerations

The Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps (FIRM) are used to determine the extent of the 100 year and 500-year flood. The existing well field control building is in Zone C, an area of minimal flooding.

Refer to Figure 2.7: FEMA Flood Insurance Rate Map.

2.3 Ownership and Service Area

2.3.1 Financial Status of Existing Facilities

The Town of Keene currently charges the users based on the total usage per service connection. According to the Town there are 263 Equivalent Dwelling Units (EDU) that are billed as single households. As of 2019 the Town bills each user \$425 annually.

2.3.2 Water System Management

Keene Water District #2, which services the Hamlet of Keene Valley, is owned, and operated by the Town of Keene.

2.3.3 Population Trends and Growth

The Hamlet of Keene Valley (Water District #2) has approximately 165 year-round residences. This number increases during the summer months to approximately 240. People are attracted to the many offerings around Keene Valley including hiking, skiing, hunting, and fishing, to name a few. Future development is not included within the scope of this report and will be provided at a future date.

2.3.4 Historical and Projected Water Use Data

a. Type of Use

The Town supplies water to residential and local business users. It is expected that the Town continue to supply water in this way. At the time of writing this report, the Town is not expecting to supply water to industrial users.

b. Equivalent Dwelling Units (EDU)'s

There are 263 user units that are paying into the debt.

c. Daily Demands

The existing daily demand is approximately 170 GPM or 0.245 MGD.

d. Peak Hourly Flow

The highest fire flow value in Water District #2 is 2,250 GMP for a two-hour duration. This is supplied by the Town's water storage tank.

e. Unaccounted Water

The Town of Keene maintains water metering and actively pursues any potential leaks. The Town has noticed a steady leak of an average of 16 GPM which the water operators have attributed to the installation of a compression fittings on ¾" laterals. These compression fittings need to be replaced. In general, there are not expected to be significant problems with leaks within the system.

2.4 Community Engagement

Local residents understand that a reliable water source is essential to day-to-day activities and the growth of the Town. Water issues are communicated to the residents at Town Board meetings.

2.5 Existing Facilities & Present Condition

2.5.1 General Description & History

Wells

The Town currently is operating their water system using two (2) wells located on a parcel owned by the Keene Central School District. In 2000, less than a year after construction, one of these newly constructed wells (Well #2) began experiencing a significant decline in production. At that point, for all intents and purposes, Well #2 was taken offline. The Town had been operating their water supply system utilizing a singular well, Well #1 since that time. Well #1's production began to decline over time. The loss of production may be attributed to the sanding of the production fractures within the well or the clogging of the fractures themselves. With only one well operating and operating at a reduced capacity, the Town was a risk of running out of water.

In July of 2019, a secondary well (Well #3) was installed to comply with New York State Department of Health's (NYSDOH) requirement of having at least two (2) mechanically redundant wells. As part of the 2019 project, Well #2 was formally disconnected from service.

With the new Well #3, Well #1 cannot provide enough water and is rarely if ever used. Therefore, the Town again does not have a sufficient second well to meet the requirement of having a mechanically redundant well. This well must be replaced. The mechanically redundant well should be located so as not to impact the primary well during any rehabilitation efforts.

Water Supply Building

The 27' by 19' water supply building, located on the Keene Central School parcel, was completed in tandem with the installation of the two (2) original wells. The water treatment system utilizes the addition of sodium hypochlorite prior to distribution and storage. The water supply building is currently supplied by the original well, Well #1 (not current in service), and the new well, Well #3.

Water Storage Tank

The storage tank is located just off of John's Brook Lane, approximately one (1) mile northwest from the water supply building. The water storage tank is a 500,000-gallon tank installed in 2010.

There was a known leak within the storage facility that has since been fixed by the tank manufacturer, DN Tanks, by epoxy sealing the interior of the tank.

The storage tank currently does not have a dechlorination system installed on its outfall.

The storage tank does not have an internal mixing system.

Water Meters

The Town does not currently have water meters for its customers. Water meters are often requirements of NYSDEC for water supplies. The Town may be required to add water meters at some point in the future.

Refer to Figure 2.8: Existing Water Supply and Storage.

Refer to Figure 2.9: Existing Well Field Map.

2.5.2 Source Capacity

a. Description of Watershed

The watershed and resulting Wellhead Protection Area (WHPA) is approximately 1,000 acres. This includes a potential area of impact with a radius of 2,250 feet around Well #3, the areas between the south side of Johns Brook and the West side of the AuSable River, and the upgradient areas southwest of the wellhead generally defined by Rooster Comb, Hedgehog Mountain and Snow Mountain.

The upland areas are largely forested and contain few potential sources of contamination. There is a notably thick layer of lakebed clay at the well site that offers some protection from potential surface contaminants.

b. Ground Water Source

Hydrosource Associates (HSA) tested Well #3 and was able to determine that 300 gpm can be considered a **conservative safe yield. According to HSA's** pump test data, the well would be expected to consume only 30% of available draw down.

2.5.3 Water Quality

The most recent well, Well #3, was tested using a NYSDOH Part 5 at the end of a 72-Hour pump test. No parameter exceeded a Primary Maximum Contaminant Level (PMCL). Volatile organics were not detected. Bacteriological parameters were non-detects. Total Dissolved Solids (TDS) was 86 mg/L. Hardness was 60 mg/L indicating soft water. Well #1 was not tested as it is due to be replaced.

2.5.4 Unit Process Evaluation

<u>SCADA</u>

The SCADA system is the original installation, several components have failed, and the remaining original components are outdated. The components that have not been recently replaced are out of date and nearing the end of their useful life.

Chlorination

The chemical feed system is located inside the main room of the well field control building. The chemical feed system is experiencing corrosion and is showing its age. There is currently not a way to isolate the storage of the chemicals or chemical feed system from the main room.

Wells

Well #1's components are assumed to be nearing the end of their useful life. The well itself is not producing sufficient water to meet the Town's demand.

Well #3, having been installed in 2019, is presumed to be in good condition.

Well Field Control Building

The well field control building has aged electrical, mechanical, and architectural features. The main problem with the building is that it is small and poorly laid out. The electrical and control systems are located within the same room as the water mains and there is poor ventilation. This coupled with corrosion from the chlorination systems is accelerating degradation of the systems. The poor layout led to a lack of space for generally for working and maintenance of equipment. The building requires upgrades to these systems or replacement.

2.5.5 System Abilities

The system's fire flows, system pressures, and treatment objectives were outlined in the 2009-2010 water system upgrades with the replacement of the distribution tank and construction of the new water storage tank.

2.5.6 Generated Waste

This section is to be inserted at a later date.

2.5.7 Existing Energy Consumption

This section is to be inserted at a later date.

2.5.8 Suitability for Continued Use

Suitability of the existing infrastructure is largely dependent on the water supply source and the effects of adding additional wells in the immediate area. The well field control building recently received internal component upgrades and a new well was installed. With additional upgrades and repairs the existing infrastructure can continue to be used.

2.6 Definition of the Problem

2.6.1 Health, Sanitation, and Security

The availability of water service to the Hamlet is vital to the success of their tourism and the continued water service to their residents. Ensuring adequate water service to the Hamlet is the responsibility of the Town.

2.6.2 Aging Infrastructure

Wells

Well #2 failed and has been removed from service and was replaced with Well #3.

The Town was recently cited for operating without a mechanically redundant well because Well #1 is now in failing condition. Over the lifespan of Well #1 it has shown to have less of a sustainable yield than expected. This means

that the Town's is essentially operating solely Well #3 without a mechanically redundant well due to Well #1 not being able to produce a sufficient supply of water to serve the demand.

Well Field Control Building

The existing well field control building was constructed in 1992. This building is nearly thirty years old at the time of writing this report. It is assumed that the building and several internal components are outdated and nearing the end of their useful life. The current electrical and control system is suspected to be aged beyond its useful life. The chemical feed system is indoors and likely causing corrosion.

2.6.3 Reasonable Growth

The Town requires a reliable mechanically redundant well to ensure the protection of continued service to their residents and the school system. The Hamlet is an attractive location for seasonal tourism. The Town would like to ensure the growth and protection of this market.

2.6.4 Water and Energy Consumption and/or Waste Generation

Water and energy consumption and waste generation are within normal ranges for this type of system and are not expected to be significantly impacted by the proposed project alternative.

2.6.5 Storm and Flood Impacts

At the time of writing this report there have been no reported storm or flood impacts on the well field control building or wells in Water District #2.

2.6.6 Compliance with Accepted Standard's

The existing water supply for the system does not have a sufficient mechanically redundant well. The ultimate need for the project is to supply the Town with a new groundwater source in the form of a well. All modification and upgrades shall be in accordance with 10 States Standards, the National Electric Code, the National Building Code, and any other pertinent standards.

2.7 Capacity Development

This section is to be inserted at a later date.

3) ALTERNATIVE ANALYSIS

3.1 Alternative Description

The goal of the project is to replace the failing well and provide a mechanically redundant well along with upgrades to the well control building. The two main alternatives considered center around the control building. Full replacement vs rehabilitation was evaluated. The replacement well and water meters are common to either alternative. Two project alternates are presented to be completed if funds allow.

3.1.1 Common Components

a. Replacement Mechanically Redundant Well

A new well will be installed within the approximate confines of the existing well field. The new well will be connected to the well field control building with independent piping, electrical and controls. The exact location of the production well will be determined after completing a hydrogeological study and test well(s).

b. <u>Water Meters</u>

At the time of writing of this report there is no form of individual water metering throughout the Town of Keene. It is expected that water meters will be required by NYSDEC as a result of the installation of a new well. Water meters will be installed in each home (either in basements or water meter pits) and a fix-based meter reading system will be provided.

3.1.2 Alternative 1: Replacement Well Field Control Building

The existing well field control building will be replaced with a new well field control building. The new building will have separate spaces for chemical feed systems, electrical systems and controls, mechanical systems, water piping, and labs. The new building will be located adjacent to the existing building. Once the new building is completed, the existing building will be demolished.

3.1.3 Alternative 2: Well Field Control Building Upgrades

The existing well field control building is approximately 30 years old and requires updates to systems that are reaching the end of their useful life. Pending a formal Mechanical, Electrical and Plumbing Equipment code review the determination will be made regarding the replacement of several building related items. The items expected to be identified during the evaluations include the roof, siding, doors, controls and electrical. Evaluations may identify additional items to be addressed that were not previously listed. Implementation of SCADA, external controls and flow based chemical feed is also recommended.

3.1.4 Alternative 3: No Action Alternative

The No Action Alternative leaves the Town operating on a single well with no mechanical redundant well. Operating on the single well could leave the Town without a well water source supply during a loss of service. This alternative will not be considered further as it does not fit the criteria defined in the scope of this project or the goals of the Town. The potential loss of service to Water District #2 created by taking no action deems that this is not an acceptable course of action. This alternative will not be considered further.

3.1.5 Project Alternates

a. Water Storage Tank

If funding allows, it is recommended that the Town implement dechlorination at the tank discharge. A flow-based dosing system will be installed on the tank outfall to provide proper treatment of the chlorine residual. This system will be used to ensure the surrounding area does not receive highly chlorinated water when the water storage tank experiences an overflow or when the Town drains the tank for maintenance. The dechlorination system may be a requirement from NYSDEC at some point in the near future.

If funds allow, an internal tank mixing system is recommended. The tank mixing system helps keep the water fresh and reduces chlorine demand. The exact mixing system shall be determined during design. There are three main options:

- Passive mixing system. This type of system consists of valves on the inlet and outlet pipes to direct flow within the tank to promote mixing. These systems require the least maintenance but can be costly to install. They also have difficulty reaching peak performance in small systems, like Keene, with low tank turnover.
- Active mixing system, electrical power: This type of system consists of a mechanical mixer installed in the tank. These mixers run constantly to keep the water mixed. These are mechanical devise that require maintenance and are prone to failures. The electrical usage must be considered in O&M costs.
- Active mixing system, solar power: This is the same active mixing system except a solar panel(s) is installed to power the unit. The solar power increase installation costs but reduces O&M costs.

Leaks in the base of the tank were repaired in 2020. If any additional work to repair the tank is discovered, it should be addressed as needed.

b. <u>Hiker Center Connection</u>

The Town primarily intends to construct a Hiker Welcome Center on Marcy Field. Potential components to this project will include water main to service the Hiker Welcome Center.

In addition, the Town may incorporate additional users into the water district within reasonable distance to the new Welcome Center water main.

Final lengths of the water main and laterals and all remaining design components will be determined in the engineering design phase.

3.2 Impact on Existing Facilities

3.2.1 Alternative 1

Installing a new well field control building will allow the existing facility to remain online throughout construction. This will allow the Town to maintain water service.

3.2.2 Alternative 2

Rehabilitating the existing well field control building will require coordination and temporary facilities to allow the facility to maintain full operations. This will require considerable coordination during construction.

3.3 <u>Map</u>

Alternative Project Maps will be included at a later date.

3.4 Environmental Impacts

a. General Impacts of Replacement Alternatives

Both alternatives will have short term local impacts, that can be mitigated by proper construction methods, stormwater control, noise pollution, etc.

b. Alternative Specific Impacts

None

3.4.1 Land Requirements

a. Land Acquisition

The Town is required to own the land within the 100-foot radius of any well. The final siting of the new wells for either Alternative will determine if any land acquisition is required. Currently this is not the case and Keene Valley Central School owns the property that the well heads are currently located on. The Town will need to acquire the land surrounding the well heads to ensure proper well head protection practices are maintained.

b. Plant Expansion

No immediate future plant expansion is anticipated.

c. Easements Required

Temporary and permanent easements may be required to meet state and federal guidelines. The Town will need to ensure that they have easements in place for land within a 200-foot radius of the well to be able to enforce well head protection requirements to minimize potential risk of well contamination. Additionally, the Town will need easements for any new infrastructure located on neighboring properties.

If the Town cannot secure the minimum amount of land required for the well head protection setbacks, then the Town will be required to seek out a permanent easement with the Keene Central School.

d. Land Restrictions

There does not appear to be any applicable local land restrictions on the known areas of work. All work will comply with APA and DEC setback restrictions where they apply. There are required setbacks laid out by DOH for wellhead protections.

3.4.2 Potential Construction Problems

At the time of writing the report the main issue with construction is the determining the location of a reliable water supply source.

Phasing must be done in such a way that the existing plant can remain online throughout construction. Additional phasing and coordination will be the responsibility of the contractors and they will be required to submit a phasing plan as part of their submittals.

3.4.3 Sustainability Considerations

a. Water and Energy Efficiency

i. Alternative 1:

Alternative 1, may reduce energy with an increased efficiency of a new building.

ii. Alternative 2:

Alterative 2, does not likely significantly change energy usage.

b. Green Infrastructure

By nature, the project simply focuses on providing the Town a reliable mechanically redundant well. There is little opportunity for green infrastructure. Energy conscious engineering practices will be implemented such as the selection of new efficient motors and variable frequency drives throughout design and upgrades where appropriate.

3.4.4 Schedule and Constructability

The well system must remain online throughout construction. The contractor must coordinate with the Town to ensure service is maintained.

Alternative 1 is simpler to construct. The new well field control building would be constructed while the existing systems remain online.

Alternative 2 will require significant coordination for construction to occur and maintain water service. It is likely that temporary services will be required for electrical, controls, chemical feed systems, and possibly water systems while building systems are upgraded. The existing building is very small with little working room.

3.4.5 Operations and Maintenance

The O&M (Operations and Maintenance) of both alternates will be relatively the same.

3.5 <u>Cost Estimates</u>

Refer to Table 3.1: Alternative Cost Comparison.

4) SUMMARY & COMPARISON OF ALTERNATIVES

4.1 Alternative Summary and Comparison

The replacement well field control building provides a better long-term layout for the building and allows for complete replacement of a poorly laid out building as well as replace all aging infrastructure. A new building will also be considerably simpler to construct while maintaining service to the water system. With such a small, but complicated building, the cost benefit of upgrading a building vs building new leans heavily in the favor of building new.

5) RECOMMENDED ALTERNATIVE

5.1 Basis of Selection

Alternative 1, constructing a new well field control building, along with the common components, as well as alternatives. The exact final scope of each item and the inclusion of common components shall be based on preliminary design, review of any existing and new hydrogeological studies, and final cost/grant awards.

5.2 Preliminary Project Design

5.2.1 Water Supply

At the time of this report the Town currently has a water supply demand of 170 GPM or 0.245 MGD. The wells have generated water of good quality. Well #3, at the end of a 72-hour pump test, showing no PMCLs exceeding their limits.

5.2.2 Treatment

If a new well source is found within the existing well field, it is assumed that the water will need the same forms of treatment as the existing onsite wells. Water testing will be performed during development of the well to determine final treatment processes. The Well Control Building will be replaced.

5.2.3 Storage

No additional storage locations are planned for design and are out of the scope of this project. A dechlorination system may be added if required. If any additional repairs are needed, they should be completed.

5.2.4 Pumping Stations

No additional pump stations are planned for design and are out of the scope of this project.

5.2.5 Distribution Layout

Modifications to the water system include the installation of transmission mains from the new well to the existing well field control building. The sizing and length of the raw water transmission main will be determined in final design.

If selected, new water mains will be installed to service a new welcome center at Marcy Field.

5.2.6 Water Meters

If selected, an evaluation will be performed to determine the most effective implementation of a water metering system.

5.3 Project Map

The project map shows what is encompassed by the existing well field and building location.

Refer to Figure 5.1: Alternative 1 – Site Plan.

5.4 Permit Requirements

The project will be held to NYS DOH standards.

5.5 Project Schedule

The proposed project funding is expected to take approximately two years for funding, one year for design and two years for construction.

5.6 Total Project Cost Estimate

Refer to Table 5.1: Alternative 1 – Cost Estimate.

Refer to Table 5.2: *Project Financing and Estimated User Rates (WIIA Grants)*. Please note these grants have not yet been secured and only represent possible funding scenarios.

Refer to Table 5.3: Project Financing and Estimated User Rates (No Grants).

Preliminary Report Proposed Backup Well Source Town of Keene, New York

Submitted to

The New York State Department of Health and the New York State Department of Environmental Conservation

January 7, 2019

A Report By

HydroSource Associates, Inc.

50 Winter Street, P.O. Box 609 Ashland, New Hampshire 03217 (603) 968-3733

Preliminary Report Proposed New Groundwater Source Town of Keene, New York, Village of Keene Valley

submitted to

The New York State Department of Health (NYSDOH) and The New York State Department of Environmental Conservation (NYSDEC)

January 7, 2019

1.0 Introduction

The Town of Keene operates a water system serving the hamlet of Keene Valley (Keene Water District #2). The system is served by two bedrock wells at the south edge of the athletic fields adjacent to the local school (Figure 1, Figure 2). The primary well, Well 1, has been a reliable water source for the District since the well was constructed in 1992. However, experience has shown that the second well, Well 2, is not an adequate backup. The Town of Keene made a decision to develop a new backup well on the same property.

The Town hired HydroSource Associates (HSA) to search for an optimum site for a backup well. HSA has been working on this project with guidance from Todd Hodgson of Essex County. HSA carried out tasks including an assessment of background information on the wellfield, review of the site's geology, geophysical surveying, and test drilling. The work culminated in construction of a screened overburden well that is considered likely to be capable of meeting the Town's yield target. The new well is named Well 3.

This report is being submitted to the New York State Department of Health (NYSDOH) and the New York State Department of Environmental Conservation (NYSDEC). The purpose of the report is to provide the agencies with the information they need to make a preliminary judgment on the new well's ability to be approved as a water source for a public water supply. The report includes the following information:

- review of background hydrogeology;
- assessment of the existing wells and wellfield history;
- results of geophysical surveys;
- documentation of construction of the new well;
- preliminary delineation of a Wellhead Protection Area (WHPA);
- inventory of potential contaminant sources, and;
- proposed specifications for a 72-hour pumping test.

2.0 Geology

Although the two wells that currently supply water to the Keene Valley system are both bedrock wells, Well 3 is a gravel-pack well completed in a sand layer just above the bedrock surface. Consequently, this report will provide only a brief overview of bedrock geology at the site, and will focus on surficial geology.

Figure 3 is a map of bedrock geology, based on published mapping at a scale of 1:250,000 (Isachsen & Fisher, 1970). All of the bedrock in the Keene region is of Precambrian age. Most of the rock near the wellfield is anorthosite of the Marcy massif, the dominant intrusive body of the Adirondacks Highlands. The intrusion's age is about 1.12 billion years (Williams et al., 2018). Small occurrences of related high-grade metasedimentary rocks can also be seen on Figure 3.

A number of faults are shown on Figure 3. The most prominent set of faults has a northeasterly trend, and the faults at this orientation are part of a family of faults that traverses the Adirondacks Highlands. Some of these faults coincide with well-defined northeast-trending valleys. However, the East Fork of the Ausable River closely coincides with a north-trending fault over much of the length of Keene Valley.

Little evidence of structural disruption is seen in outcrops near the Keene Valley wellfield. The closest exposures of anorthosite west and south of the wellfield are massive, displaying little jointing (Figure 4). Foliation in the anorthosite is visible but subdued.

Figure 5 is a map of the surficial geology of the area surrounding the school property, based on recent mapping of the Keene quadrangle (Clift & Graham, 2013). The majority of the higher-relief areas on both sides of the valley are underlain by glacial till ("diamicton" in the terminology of the published map). The thickness of the till is highly variabled, and anorthosite outcrops are common in the uplands.

Overburden along and near the flat floor of the valley is related either to the glacial lake that occupied the valley roughly 13,000 years ago (lithology code "Ps" of Figure 5), or to subsequent reworking of the glacial sediments by the East Fork of the Ausable River after the ice had retreated and the glacial lake had drained (lithology code "Hs").

Flat-topped delta forms can be seen west and south of the wellfield. Those to the west formed where meltwater streams in the Johns Brook drainage entered the glacial lake. The delta to the south formed at the mouth of the next major drainage to the south, on the east flank of Rooster Comb. Based on the elevation of the flat tops of the delta deposits, the water level in the glacial lake must have persisted at an elevation of about 1100 feet during the time when the neareby deltas were being built out into the lake. The elevation of the wellfield itself is about 1030 feet.

- mu Metasediments & related migmatite
- Faults

Figure 4 - Massive Anorthosite Outcrop

The sand and gravel that underlies much of the flat floor of the valley is probably thin in most places. At shallow depth, it is underlain by clay and silt deposited in the glacial lake. At the site of the new well, the silt and clay layer extends to a depth of 99 feet. The material intersected in the wellbore appears to be the classic varved clay that is typically deposited in glacial lakes in the northeast, with each thin varve lamination corresponding to one year's deposition of fine-grained sediment in the quiet water of the lake.

More information on the surfacial geology will be provided in the section covering construction of Well 3.

pCbr - bedrock (anorthosite)

3.0 Existing Wells

Water for Keene Water District #2 presently is supplied by Wells 1 and 2. Both of these bedrock wells were drilled and installed by Boyd Artesian Well in the 1990s on the property of Keene Central School, at the south end of the school's athletic fields. Figure 6 shows the locations of the wells in the existing wellfield, along with the location of Well 3 and two resistivity survey lines that are discussed in the next section. Testing done in 2006 indicated that the sustainable yield of Well 1 is more than 200 gallons per minute (gpm), and the well has been shown to be capable of satisfying the system's needs since it first went online. Well 2, the backup water supply, is less productive. Although 2006 testing reportedly had indicated the well could sustainably produce as much as 150 gpm, the Town's operational experience since that time has indicated the yield is much lower.

The informal driller's log from Boyd Artesian Well provided in the 2006 Caswell report confirms that Well 1 has always been substantially more productive than Well 2. The Caswell report is provided in Appendix A. Well 1 had an airlift yield of 300 gpm at the end of drilling. The well was drilled through the overburden by advancing eight-inch-diameter steel casing to a depth of 98 feet. The driller's notes say that an Odex drive shoe was used, which means that it should have been possible to collect representative samples of the overburden during drilling. However, the notes include no information on the sediments, and therefore it is not known whether the water-bearing potential of the sedimentary aquifer was seriously considered when the wells were drilled. It can be assumed that the casing was seated one or two feet into solid bedrock, which means that the unconsolidated sediments at Well 1 are no more than 96 feet thick.

The driller's log reports that Well 1 contained a single water-bearing fracture at a depth of 138 to 140 feet. At the end of drilling to the well's final depth of 270 feet, the airlift yield was reported as 300 gpm. A 72-hour pumping test was conducted at a rate of 221 gpm, and by the end of the test pumping had produced 27.5 feet of drawdown, to a final level of 40 feet.

Well 2 was drilled using the same Odex casing advancement method. This well used 80 feet of eight-inch casing, indicating that bedrock is a little shallower at this site. Well 2 was initially drilled to a depth of 270 feet, with a reported airlift yield of 70 gpm at that depth. The notes do not report the depth of water-bearing fractures. The well was deepened to 395 feet, and a fracture producing an additional 50 gpm was encountered at 390 feet, resulting in a total airlift yield of 120 gpm. Caswell estimated that the sustainable yield of Well 2 was "in the range of 140 to 150 gpm," but the Town's experience using the well shows that this estimate was too optimistic.

Legend

Town wells
 Resistivity lines
 Property lines

Figure 6 shows a well labeled "sanding well" that is only about 15 feet east of Well 1. Figure 7 is a photograph of the existing wellfield facing north that includes this well. The Town has little information on the sanding well. It evidently was sited close to Well 1 to try to tap the same fracture that accounts for the primary well's productivity. The well is reported to have shown a yield of 300 gpm, but it had chronic sand production problems. The source of the sand is unknown. One possibility is that the casing was not seated deeply enough into bedrock, allowing sand at the bedrock surface to leak into the borehole. Another possibility is that shallow fractures are providing a sand pathway between where the fractures reach the bedrock surface and where they intersect the borehole. The Town concluded that further investment in this well was not prudent. NYSDOH requested that the Town properly abandon the well, and the Town plans to do this after Well 3 has been permitted.

Note that Figure 7 shows three wells that have not been previously discussed. We have not encountered records on these three wells, which appear to be six-inch-diameter bedrock test wells that were drilled prior to construction of each of the larger-diameter wells. We have arbitrarily assigned names to these wells, using the prefix "BRTW" to stand for "BedRock Test Well." Well BRTW-1 is about five feet from Well 1; Well BRTW-2 is the same distance from Well 2; and Well BRTW-3 is the same distance from the sanding well. These wells will be used as aquifer monitoring points during the constant rate test of Well 3.

4.0 Geophysical Surveys

Resistivity surveys were conducted along two lines during the week of August 14, 2017. The line locations are shown in Figure 6. Figure 8 is the resistivity profile along Line 1, which also shows where Well 3 was drilled on the line, and includes a simplified description of the sedimentary sequence encountered in the well.

Inspection of Figure 8 shows a thin near-surface layer protrayed in shades of red. This relatively high-resistivity material is the unsaturated sediment layer above the water table. HSA's interpretation of the water table position is shown by the upper dashed black line.

Beneath that is a zone shown mostly in the shades of blue and green that represent lower resistivities. The regions in shades of blue probably roughly concide with the lakebed clay and silt layer. Under this layer is a region of intermediate resistivity portrayed in green and yellow. At the position of Well 3 on the resistivity line, much of this interval corresponded with fine-grained to medium-grained sand. Indeed, the Well 3 site was chosen because the low-resistivity layer (the lakebed clay) appeared to be interrupted at that location by material with higher resistivity, in the range that often would be associated with coarse-grained sand and gravel. This will be discussed further in the section on drilling of Well 3.

Finally, a zone of higher resistivity is shown near the middle of the line, and this has been interpreted as representing bedrock. The dashed line marking the interpreted bedrock surface shows an irregular surface, with bedrock coming within 100 feet of the ground surface about 250 feet east of Well 3. The depth to bedrock at the existing wells is around 100 feet, which confirms the interpretation of shallowing bedrock for at least a short distance toward the east. The topography of the shallow-to-bedrock uplands immediately to the southwest of the well site shows a strong northeast-trending ribbed pattern. There is no reason to expect that this ribbed bedrock topography pattern would not persist at depth beneath the wellfield.

Figure 8 - Line 1 Resistivity Profile

5.0 Well 3

Typically on a project like this one, construction of a production well at a previously untested site would be preceded by drilling of a six-inch-diameter test well to confirm the existence of an aquifer with the potential to meet a project's yield target. In this case, the Town made a decision to forego construction of a test well, and instead to move directly to installing a well with a diameter large enough to be used as a supply well, assuming that the Town's yield and water quality criteria were satisfied. A well with a diameter of eight inches was judged to be adequate to produce the volume of water required by the system, and the Town was willing to risk the incremental cost associated with the larger diameter.

5.1 Construction - The plan was to advance eight-inch casing to the bedrock surface, assessing the potential of sand and gravel deposits in the unconsolidated overburden. If insufficient potential had been seen in the overburden, the well was to be continued deeper to test the bedrock. As it happened, a productive sand layer was encountered in the sediments just above the bedrock surface, so that testing of the bedrock became unnecessary.

The Well 3 borehole was drilled on October 24, 2018 by Layne Christensen using a dual-rotary drill rig (Figure 9). Drilling began with advancement of temporary 12-inch-diameter surface casing to a depth of 25 feet. After that, eight-inch diameter casing was telescoped inside the surface casing, and advanced to the bedrock surface, which was encountered at a depth of 150 feet. Bedrock is fresh anorthosite similar to the rock in nearby outcrops (Figure 4).

The uppermost 22 feet of sediment is cobble gravel. This is underlain by varved gray lakebed clay that continues to a depth of 99 feet. The clay overlies brown, silty fine-grained sand that grades into medium-grained to coarse-grained sand beginning at 107 feet. The medium/coarse sand layer is quite uniform. It continues with little obvious grain size variation to the bedrock surface at 150 feet, with the addition of scattered pebbles in the last eight feet.

Sediment samples were collected at two-foot intervals beginning at a depth of 105 feet, and continuing to 150 feet. Each sample was split, with one sample set retained by Layne and the other by HSA. The two companies independently conducted grain size frequency analysis for the samples in the interval of interest.

The result of the sieve analysis confirmed the subjective observation that the sand is remarkably uniform. The sieve results were used to generate a custom screen design, following standard industry practices. The screen design is a simple one, consisting of 15-slot wire-wrap screen in the interval from 120 feet down to 150 feet. This puts the top of the screened interval 13 feet below the base of the fine-grained sand layer.

The screen was installed on November 27. From top to bottom, the screen assembly consists of: a K-packer (6 inches long) that snugly fits inside the eight-inch casing; tightwound screen (2 feet long); the 15-slot stainless steel wire-wrap screen (30 feet long); and a stainless steel end cap. After the screen assembly had been set at the intended depth, the eight-inch casing was withdrawn far enough to expose the entire length of screen. Figure 9 - Keene Valley Well 3 Graphic Log Project: Keene Valley Well: Well 3 Completion date: 11/28/18 Well depth: 150 ft

Yield: 90 gpm Driller: Layne Water Level: 17.5 ft below TOC

5.2 Development - The well was developed using the pump-and-surge method. Pumping was done by injecting compressed air into an eductor tube whose open end was just above the surge block. The procedure involved stationing the surge block within a given screen interval for a limited period of time. That time was broken up into alternating periods of pumping with surging, surging alone, or pumping alone. Then, the surge block was moved to the next depth interval (higher or lower), and the process was repeated. Observations were made periodically of the rate of sand production, and observations of specific capacity were made once or twice each day. Multiple passes were made through the screened interval. A total of 24 hours of development time was applied.

The pumping rate during the development process was consistently about 90 gpm. There was little change in the well's specific capacity over the course of the development period. Specific capacity generally varied between 15 and 16 gpm/ft, corresponding to a little less than 6 feet of drawdown at 90 gpm. The sediment production rate during surging gradually diminished with development time. By the time the operation had been completed, sand production was reported to be negligible under surging conditions, and pumping without surging resulted in sand-free water production at 90 gpm.

5.3 Step Test - A step test was conducted on Well 3 on December 6. The test consisted of six rate steps, each lasting one hour, with rates ranging from 125 gpm to 300 gpm (Figure 10). The static water level was 17.28 feet below the top of the casing, and the stickup of the measuring point above ground surface was about four feet. Recovery measurements were made for 30 minutes after the end of the 300-gpm step.

Inspection of Figure 10 shows that each rate increase was marked by a brief immediate water level decline, followed by a period of relatively stable water levels for the remainder of the step. The greatest water level depth at the end of the 300-gpm step was 42.44 feet, for drawdown of 25.16 feet and a specific capacity of 11.92 gpm/ft. Shutdown of the pump at the end of the test resulted in recovery of most of the drawdown in the first minute, followed by a period of slower continued recovery.

Figure 10 - Step Test Water Levels

Figure 11 shows the same data, with the horizontal time axis shown as a logarithmic scale, and with data plotted with respect to minutes since the start of each step, or since the start of recovery. The curves for all of the rate steps show subhorizontal trends, and the water level appeared to have approached stabilization by the end of each step. Recovery performance appears strong.

Figure 11 - Semilog Water Level Graph

Figure 12 shows the variation of specific capacity vs. flow rate for the six flow rate steps. Specific capacity remained within a relatively restricted range, varying from 13.60 gpm/ft at 125 gpm to 11.92 gpm/ft at 300 gpm.

Figure 12 - Variation of Specific Capacity vs. Flow Rate

The top of the screen in Well 3 is at a depth of 120 feet. Assuming that the well were to be outfitted with a pump with an intake screen at 110 feet, and assuming a water level 13 feet below ground surface, then available drawdown would amount to 97 feet. Thus, the drawdown produced by the 300-gpm step amounted to about 25% of available drawdown.

Water samples were collected from the Well 3 discharge stream near the end of the final step, and were analyzed for a range of water quality parameters. Results for a few key parameters are provided in Table 1, and lab reports are provided in Appendix B.

Overall, water quality looks to be quite good. No parameter was present above its allowable Maximum Contaminant Level (MCL). No volatile organic compounds were detected. The common "nuisance" parameters iron and manganese were both below lab detection limits. Hardness, at 65 mg/L, is below the value of 100 mg/L that marks the division between "soft" and "hard" water. The level of total dissolved solids (93 mg/L) is modest.

Parameter	Result	Units
Chloride	16.0	mg/L
Fluoride	<0.5	mg/L
Nitrate	<0.5	mg/L
Nitrite	<0.5	mg/L
Sulfate	6.0	mg/L

Manganese	<0.004	mg/L
Sodium	8	mg/L
Hardness	65	mg/L
pН	7.5	-
TDS	93	mg/L
Alkalinity	40	mg/L
Gross Alpha	0.4 +/- 0.7	pCi/L
Uranium	< 0.001	mg/L

6.0 Conceptual Model

Figure 13 is a schematic east-west cross section through the Well 3 site, from Route 73 on the east through the delta on the line's west end. Well 1 has been projected onto the plane of the section. The section has a vertical exaggeration of 2:1. The location of the section line is shown on Figure 5. The water table has not been shown on the cross section because it is not practical to show it at the scale of the section, but water was about 13 feet below ground surface at Well 3 when the step test was run.

The cross section shows the bedrock surface as irregular. The depth to bedrock is 150 feet at Well 3, but only 98 feet at Well 1. The shape of the bedrock surface has also been drawn to generally honor the pattern seen in the resistivity profile (Figure 8). It is worth noting that the main water-bearing fracture in Well 1 is at about the same elevation as the bedrock surface at Well 3.

Figure 13 - Cross Section

The cross section shows the sand layer tapped by Well 3 as being continuous with the delta to the west, but that does not mean that the sand layer at Well 3 was being deposited at the same time as the delta in the cross section was being built out into the lake. The delta top at 1,100 feet might be graded to one of the later, lower levels of the glacial lake that occupied the valley. Clearly, the sand layer tapped by Well 3 must have been deposited very early in the glacial lake's history, because it is the first sediment deposited after the ice left the bedrock surface exposed. The lake level at the time of the sand's deposition may have been considerably higher than the level of the delta top in the section. The important point is that the sand is likely to extend relatively continuously toward the west valley wall, since tributary streams and the shore of the lake along that adjacent valley wall are the likeliest source of the sediment. If the sand layer is indeed continuous to the west, then water flowing toward Well 3 will likely have originated in the upgradient western watershed areas.

The cross section shows the basal sand interval pinching out east of Well 1. The presence of the sanding well suggests that the sand layer must persist at least as far east as that well. As already discussed, it seems likely that the source of the sand entering the well must be a shallow fracture connecting the wellbore at a point just below the bottom of the casing. The fracture must have a steady source of sand from the point where the fracture intersects the bedrock surface nearby, and thus there must be a layer of sand directly overlying bedrock in that area. The large volume of water produced by this well (reportedly around 300 gpm) also would be consistent with a good connection to a prolific aquifer in the sediments at the bedrock surface. If this explanation is correct, then it seems reasonable to expect that the 72-hour pumping test of Well 3 will produce a well-defined impact at the sanding well.

The layer of varved clay overlying the sand might represent several hundred years of deposition in the glacial lake. The thick clay layer would be expected to provide ample protection from surface contamination at the well site, or from points to the east.

Figure 14 is a perspective view of Keene Valley looking toward the southwest. The image is a hillshaded digital elevation model, and like the cross section it uses a vertical exaggeration of 2:1. The wells are labeled, and the school property is shown by the dark blue line. The translucent blue surface, at the modern-day elevation of 1,100 feet, is intended to show the glacial lake level when the flat-topped deltas nearest the wellfield were forming, graded to the lake level at their time of formation (the modifer "modern-day" being necessary because isostatic rebound following removal of the ice sheet was incomplete when the glacial lake occupied the valley).

Two such deltas are labeled, one of them coming out of the Johns Brook drainage, the other growing from the mouth of Flume Brook. The image makes it clear that the basal sand tapped by Well 3 must have been transported by meltwater originating from the tributary drainages on the west side of the valley. It should also be kept in mind that when the glacial lake first became established and the basal sand was being deposited, much of the valley may still have been occupied by residual ice that could have limited the available pathways for meltwater flow. Thus the productive sand layer could represent delta foreset beds, the distal facies of beach deposits, or deposition from higher-velocity meltwater flowing between remnant ice chunks partly floating in the lake.

Figure 14 - Perspective View toward Southwest

7.0 Wellhead Protection Area (WHPA) and Potential Contaminant Sources

Figure 15 shows the proposed WHPA around Well 3. This preliminary WHPA takes in an area of roughly 1,000 acres. The WHPA was delineated by starting with the assumption that the cone of depression associated with the proposed groundwater withdrawal would extend 1,000 feet from Well 3 in the unconsolidated sedimentary aquifer. The WHPA was then drawn to enclose this 1000-foot radius, plus a small buffer, and to take in the upgradient watershed area beyond the extent of the glacial sediment aquifer. This includes the high-relief slopes south and west of Trail End Road, which are exposed bedrock or covered with a thin layer of till. The eastern boundary of the WHPA is taken as the East Branch Ausable River. The WHPA will be refined as necessary based on water level observations made during the 72-hour pumping test of Well 3.

A preliminary review was made of potential sources of groundwater contamination in the area surrounding the proposed well site. Only a few potential contaminant sources have been identified, and these are shown on Figure 15. A query was made of the NYSDEC database of bulk storage tanks. The three sites within the WHPA having database entries are listed in Table 2, and their locations are shown on Figure 15, marked by the map codes shown in the table. Tanks at two of the sites remain in use, but those at the Keene Valley Garage have been closed.

A query was made of the NYSDEC spills database, covering spills that occurred over the past 10 years (Table 3, Figure 15). Only one spill with a known mapped location appears to have occurred within the WHPA, and that was a half-gallon of gasoline, apparently at one of the underground tanks at the school. The only other spill having a definite location within the map view of Figure 15 is a spill of fuel oil that occurred one-quarter mile downstream from the edge of the WHPA near the junction of Johns Brook with the East Branch Ausable River.

Two spills of transformer oil occurred at unspecified locations along Route 73, but whether the location of either one was in the WHPA is not known. An unknown quantity of transmission fluid was spilled somewhere along Johns Brook in 2008, presumably from a motor vehicle accident. None of the spills listed in the database would appear to constitute a serious contaminant threat to the Well 3 aquifer.

Table 3 - Spills

SpillsWHPA

Figure 15 - WHPA & Potential Contaminant Sources

A query of the NYSDEC Environmental Site Remediation database turned up no entries in or near the WHPA.

Most of the area inside the WHPA is mountainous, undeveloped forest, in which little activity takes place that would be considered to present a threat to groundwater quality. Land uses on the valley floor at the north end of the WHPA include residential housing, the school, and a few commercial establishments along Route 73 that do not involve routine handling of hazardous materials. It is assumed that fertilizer and pesticides may be applied to the school's athletic fields. The nearest commercial establishment is the Trails End Bed & Breakfast, 500 feet northwest of the well. Overall, the WHPA contains few sites hosting land uses that appear to pose a contamination risk. Beyond that, the thick layer of lakebed clay and silt that overlies the aquifer should provide excellent protection from local contaminant releases at the surface.

8.0 Pumping Test

Well 3 will be subjected to a 72-hour pumping test. The test will be preceded by a seven-day ambient conditions monitoring period. Based on the results of the step test, the targeted pumping rate for the 72-hour test will be 250 gpm. Water samples will be collected at the end of the pumping period, and analyzed for the parameters required under Part 5 of the NYSDOH regulations governing water quality standards for public drinking water sources.

Wellhead Setup - A submersible pump will be set just above the top of the screen assembly in Well 3. The pump will be powered by a portable generator. A plastic monitoring tube will be installed in the well, to eliminate the risk that the water level probe could get tangled with the pump's power cable.

A gate valve that permits precise control of the flow rate will be installed at the wellhead. A sampling spigot will be installed in the same area. The flow rate will be measured using an orifice weir that is appropriately sized for the planned pumping rate.

Monitoring Points - Points to be monitored during the pumping test are shown in Figure 16 and listed in Table 4. Plans call for monitoring water levels in: the pumping well, Well 3; Wells BRTW-1 and BRTW-2, the six-inch-diameter bedrock test wells adjacent to Well 1 and Well 2; and the sanding well. BRTW-1 and BRTW-2 are believed to be completed in the bedrock aquifer, and presumably are open to the main water-bearing fractures in the adjacent large-diameter wells.

The sanding well is considered to constitute a reasonable substitute for a monitoring well completed in the basal sand. The well's chronic sand production problem under pumping conditions suggests that near-surface fractures are providing a direct pathway for movement of sand from the bedrock surface into the well. If the fractures permit that much sand production, they may also provide a good hydraulic connection between the sanding well and the basal sand layer.

Table 4 - Monitoring Points

A well point will be driven a few feet into the sediments beyond the end of the Well 3 drill pad (Figure 16). The water table is quite close to the surface in that area. A staff gage will be installed in the wetland southwest of Well 3.

A rain gage will be set up on the site at the beginning of the monitoring period. For parts of the monitoring period when personnel are not at the site, weather data gathered at the site may be supplemented with data from the nearest recording weather station, which is four miles north in Keene.

The orifice weir will be set up at the edge of the pond south of the existing wellfield, about 450 feet from Well 3. At the point where discharged water strikes the ground, the ground surface will be protected from erosion using plywood or plastic sheeting.

Monitoring Schedule - Letter codes in Table 4 refer to different monitoring schedules in Table 5. The testing period is divided into ambient conditions, pumping period, and recovery period categories. The ambient conditions monitoring period will have a duration of seven days. The pumping period will be 72 hours. Recovery measurements will be made until 90% recovery has been achieved, but at least for 24 hours.

Water levels will be measured manually using a Solinst-style water level probe in Well 3 for the pumping period and the beginning of the recovery period. A pressure transducer will be used to measure water levels in that well during the ambient conditions period and the later part of the recovery period. Transducers will be used in the other wells. Water levels will be measured manually in the shallow piezometer.

Schedule	Methods/Monitoring Frequency		
Α	Ambient conditions period: transducer, 15 minute intervals.		
	Pumping period: manual; once a minute through 10 minutes; once		
	every two minutes through 20 minutes; once every five minutes		
	through 50 minutes; once every 10 minutes through 120 minutes;		
	hourly thereafter.		
	Recovery period: manual first two hours, and same schedule as		
	pumping period; thereafter, transducer, 15-minute intervals.		
B Ambient conditions period: transducer, 15 minute intervals.			
	Pumping period: transducer; once every two minutes through 20		
	minutes; once every five minutes through 60 minutes; 15-minute		
	intervals thereafter.		
	Recovery period: same as pumping period.		
С	Ambient conditions period: manual; first day, last day.		
	Pumping period: manual; twice a day.		
	Recovery period: manual; first day and last day.		

Table 5 - Monitoring Schedule

Water quality analysis - Water samples will be collected for laboratory analysis of the suite of parameters that are required for public water supplies under the NYSDOH Part 5 regulations. Waivers are requested for the following list of typically waived parameters:

- Asbestos
- Beta Particles
- Polychlorinated biphenyls (PCB)
- Dalapon
- Diquat
- Endothall
- Glyphosate
- 2,3,7,8 TCCD (Dioxin)
- Bromate
- Chlorite
- Haloacetic Acids

The water samples will be collected near the end of the 72-hour pumping period, following normal sampling protocols, and abiding by lab-specified holding times.

The water quality testing will include an assessment of the risk of surface water influence (Groundwater Under the Direct Influence of surface water, or GUIDI). A microscopic particulate analysis (MPA) sample will be collected during the final 24 hours of the pumping period. The assessment will also include field measurement of pH, temperature, and TDS in samples of Well 3 discharge water and samples of water from the wetland. These samples will be collected three times a day during the pumping period to allow assessment of whether the characteristics of the water pumped from Well 3 become more like those of the adjacent surface water over time.

9.0 Final Report

A final report on Well 3 will be submitted to NYSDOH and NYSDEC following completion of the 72-hour pumping test. The report will include the following:

- documentation of the 72-hour pumping test;
- analysis of test results;
- opinion of safe yield;
- water quality summary, with lab reports;
- assessment of GUIDI risk;
- refinement of the WHPA, as appropriate;
- recommendations, on pumping regimes, routine specific capacity monitoring, and periodic redevelopment.

Final Report Proposed New Groundwater Source Town of Keene, New York, Hamlet of Keene Valley

submitted to

The New York State Department of Health (NYSDOH) and The New York State Department of Environmental Conservation (NYSDEC)

March 12, 2019

1.0 Introduction

This is the Final Report on a new well that is to serve the water system of the hamlet of Keene Valley. Well 3 is a screened well that was constructed in late 2018 on property of the Keene Valley Central School, at the south edge of the school's athletic fields (Figure 1, Figure 2). The two bedrock wells that currently serve the water system are nearby on the same property.

The Town hired HydroSource Associates (HSA) to site the new well, observe its construction, development, and testing, and to prepare this report. HSA has been working on this project in consultation with Essex County.

A Preliminary Report on Well 3 was submitted to NYSDOH and NYSDEC on January 7, 2019. That report includes an explanation of the reasons a new well was necessary, details of site geology, documentation of construction and preliminary testing of Well 3, a proposal for a 72-hour constant rate pumping test at a target rate of 250 gallons per minute (gpm), and other information intended to allow the agencies to make a decision on whether the site would be a satisfactory location for a new water source for a public water system.

NYSDOH and NYSDEC approved the Preliminary Report. However, NYSDOH suggested increasing the target rate to 300 gpm, since the results of the step test indicated that the well may support the higher rate. With NYSDEC concurrence, HSA agreed, and the test was carried out at 300 gpm.

Well 3

Well 3 was described in detail in the Preliminary Report, but the well log is provided again here (Figure 3). A well completion report is included in Appendix A. The depth to bedrock at the Well 3 site is 150 feet. The unconsolidated sedimentary sequence includes a layer of silty gravel at the surface, glacial lakebed silt and clay to a depth of 99 feet, and mostly uniform medium-grained to coarse-grained sand to the bedrock surface. Bedrock consists of light green anorthosite.

School property

Figure 1 - Location Map

Legend

Figure 3 - Keene Valley Well 3 Graphic Log Project: Keene Valley Well: Well 3 Completion date: 11/28/18 Well depth: 150 ft

Airlift Yield: 90 gpm Driller: Layne Christensen Co. Static Water Level: 17.15 ft below TOC

The well was drilled by advancing 8-inch steel casing. It was completed with 15-slot wire-wrap stainless steel screen from 120 to 150 feet. Other details on construction and development were provided in the Preliminary Report.

Pumping Test

Test Start - The Well 3 pumping test began on the morning of Monday, January 28. The 72hour test started at 10:54 (all times are reported using the military time convention; that is, 1:00 P. M. is 13:00). The initial attempt to start the test at 10:30 had to be abandoned when ice clogged the discharge line, and a section of the hose burst. The section of damaged hose was replaced. Because the temperature was near zero fahrenheit, it was considered advisable to restart the test as quickly as possible after the repair had been made, to minimize the risk that the discharge line would ice up before flow was reestablished. That is why the test was re-started at 10:54, instead of on the hour at 11:00.

Monitoring Points - Figure 4 is a map of points monitored during the test. Table 1 lists the monitored points, and shows distances between Well 3 and the other monitored points. Aquifer water levels were monitored in three wells in addition to the pumping well. Well BRTW-1 is a six-inch bedrock test well offset about five feet from Well 1, the primary supply well in the existing wellfield. Well BRTW-2 is another six-inch test well offset five feet from Well 2, the current backup well. The sanding well, near Well 1, is an eight-inch-diameter bedrock well that was originally intended to be a mechanical backup for Well 1, but which could not be used to supply the system because it displayed a chronic sanding problem.

Table 1 - Monitoring Points

Legend

- Wells •
- Driven piezometer 0
- Staff gage
- Discharge point \triangle
 - Property line

Wells BRTW-1, BRTW-2, and the sanding well were monitored using pressure transducers. Water levels in Well 3 were monitored using a manual water level probe during the pumping period and the first 20 minutes of recovery, and using a transducer during the ambient conditions period and later recovery. A barometric transducer was set above the water level in the sanding well, and the resulting data was used to correct the data from the other transducers for changes in barometric pressure.

PZ-1 is a shallow driven piezometer that was installed in a poorly drained area adjacent to the elevated area around Well 3. The screen was set about five feet below ground surface. PZ-1 water levels were measured manually using a Solinst-style water level probe. The water level at the piezometer site was near ground surface throughout the test, and in the very cold temperatures that occurred during the test the shallowest portion of the water column in the piezometer froze. To make a reading, it was often necessary to first melt the ice using a piece of rebar heated with a torch.

SG-1 is a staff gage set in a small stream near Route 73. In the original pumping test plan, the staff gage was to have been set in a wetland area upgradient to the west from the pond beside the existing wellfield. The temperature had been so low in the weeks preceding the test that the open water that had been expected to be the planned site of the staff gage was completely frozen, and no practical monitoring site was available there. As a consequence, an alternate site had to be chosen.

The chosen site is on a small drainage that flows to the northeast into a small beaver pond just west of Route 73 (Figure 4). The beaver pond is more visible in Figure 2, just to the north of a nature trail parking area at the extreme southeast corner of the school property. The water level at SG-1 is controlled by levels in the beaver pond, and those levels in turn may have been artificially elevated by inflow from the pond by the wellfield, which received the Well 3 discharge.

Wellhead Setup - The same setup used during the Well 3 step test was retained for the 72-hour test (as described in the Preliminary Report). The submersible pump had been set at a depth near 100 feet. The setup included a plastic monitoring tube extending down to the top of the pump. Electric power for the pump came from a portable diesel-powered generator. The setup included a gate valve, two sample spigots, and a pressure gage. Discharge water was carried through flexible hose to the discharge point at the edge of the pond (Figure 4). An orifice weir was set up at the berm separating the playing fields from the wellfield pond, and the discharge stream went into the swampy ground along the edge of the pond. Plastic sheeting was used under the outfall to prevent erosion.

Schedule - Monitoring began 11 days before the start of the 72-hour test. The transducers set in Well 3 and the other aquifer monitoring points were programmed to take readings at 15-minute intervals throughout the ambient conditions period.

The staff gage and shallow piezometer were not monitored during the ambient conditions period. During the pumping period, measurements were made at both points several times a day.

The transducers were reprogrammed to collect data at a higher frequency before the start of the pumping period. Water level measurements in Well 3 were made on a schedule that allowed good definition of water level trends in logarithmic time, and a similar measurement frequency was adopted for the recovery period. Recovery measurements were made for 24 hours. Appendix B includes data collected at the monitored wells, staff gage, and shallow piezometer.

Weather - Weather observations made at the Birch Point weather station, 4.5 miles north of Well 3 in Keene, were obtained from Weatherunderground. Figure 5 is a graph of temperature during the monitoring period. In this graph, and all subsequent graphs that do not use a log time scale, the pumping period is marked with a heavy blue line (that is, the time from zero through 4,320 minutes). Inspection of the graph shows that the temperature was below freezing for most of the 15-day monitoring period. The warmest temperatures occurred on the Wednesday and Thursday preceding the test, with the temperature peaking at around 40 degrees fahrenheit on the morning of Thursday, January 24 (-5,760 minutes on Figure 5).

The time of higher temperatures roughly coincides with the only measurable precipitation that fell during the monitoring period. Figure 6 shows the precipitation rate. A total of 0.69 inches of precipitation fell during the evening of January 23 through the morning of January 24. This presumably fell as rain, and it produced a small rise in background water levels in the wells (as discussed later in the report). Otherwise, because of lack of precipitation and below-freezing temperatures, the aquifer experienced no recharge events.

Variations in barometric pressure, as measured by the transducer in the sanding well, are shown in Figure 7.

Well 3 - Figure 8 is a graph of water level versus time in Well 3 during the monitoring period. The first point to make about this graph is that Well 1 pumping cycles produce an obvious impact at Well 3. Each Well 1 pumping event is marked by a temporary depression of the Well 3 water level, producing a sawtooth pattern in the curve. Six pumping cycles occurred during the 11-day ambient conditions period. One Well 1 pumping event took place about a day into the Well 3 pumping test, and another event began just before the Well 3 test ended. On average, Well 1 pumping events produced 2.05 feet of drawdown at Well 3.

Table 2 shows the individual Well 1 pumping events, based on the responses in the monitored wells. On average, pumping events lasted 9.6 hours, and the average time between the end of one event and the beginning of the next was 37.6 hours. Based on the Town's records for the total volume of water pumped during the ambient conditions period, the average flow rate of Well 1 is 141 gpm. Only Well 1 was in use during the monitoring period; Well 2 was idle.

 Table 2 - Well 1 Pumping Cycles

	Sta	irt	En	d		
Well 1 Pumping Event	Date	Time	Date	Time	Pumping Duration (hrs)	Time Between Events (hrs)
1	1/17/19	15:00	1/18/19	0:15	9.3	37.8
2	1/19/19	14:00	1/19/19	23:30	9.5	37.3
3	1/21/19	12:45	1/21/19	22:00	9.3	35.8
4	1/23/19	9:45	1/23/19	20:00	10.3	33.3
5	1/25/19	5:15	1/25/19	14:45	9.5	39.0
6	1/27/19	5:45	1/27/19	15:15	9.5	40.3
7	1/29/19	7:30	1/29/19	17:15	9.8	39.8
8	1/31/19	9:00	1/31/19	18:30	9.5	

Returning to Figure 8, the static water level during the first six days of the ambient conditions period was around 17.75 feet, ignoring the periodic declines produced by Well 1 pumping. The water level rose by about a half-foot over the next two days, in response to the rain and warming event of January 23 and 24. The static water level just before the start of the test was 17.15 feet below the measuring point at the top of the casing. The casing stickup was about four feet, so that the water level was roughly 13 feet below ground surface. Data was not collected from Well 3 during the final 17 hours of the ambient conditions period. The transducer had been removed to avoid the risk of damage while the drillers worked around the well before the test.

The target rate of 300 gpm was reached after the first few minutes, and remained within one percent of that value (that is, no lower than 297 gpm) for the remainder of the test. When the pump was turned on, the water level showed a rapid initial decline, followed by a more modest continuing decline. After factoring out the influence of Well 1 pumping, the slope of the decline diminished with time. The water level appeared to be approaching stabilization during the last minutes of the pumping period that were not affected by the final Well 1 pumping event. The water level at 5:00 on the final morning of the test (time equals 3966 minutes) was 44.48 feet, which amounts to drawdown of 27.33 feet, and a specific capacity of 10.98 gpm/ft.

Figure 9 is a graph of Well 3 water levels during the pumping period using a log-scale time axis. The affects of a flow rate adjustment can be seen during the first three minutes. The curve is essentially horizontal during the time from about 2,000 to 4,000 minutes.

Figure 9 - Well 3 Pumping Period

Figure 10 is a semilog graph of recovery period water levels. Inspection of the graph shows that a large fraction of the recovery occurred during the first minute after the pump was shut down. After that, the slope of the curve is approximately the same as the slope seen during the pumping period, again after allowing for the impact produced by the last Well 1 pumping event.

Figure 10 - Well 3 Recovery Period

One means of assessing the sustainability of a given tested flow rate is to compare the amount of water level rebound that has occurred after some specified period of recovery against the amount of drawdown that occurred after the same duration of pumping. In this case, the comparison must consider recovery and drawdown durations that are relatively unaffected by impacts from Well 1 pumping cycles. The first Well 1 pumping cycle occurring during the Well 3 pumping period began around 7:30 on January 29 (Table 2), which was 1,236 minutes from the start of the Well 3 pumping period. The last Well 3 water level reading unaffected by the Well 1 pumping event was at 1,206 minutes, when the water level was 43.66 feet, which corresponds to drawdown of 26.51 feet.

The water level after 1,206 minutes of recovery was 18.02 feet. This amounts to recovery of 26.46 feet from the maximum water level of 44.48 feet reached prior to the start of the final Well 1 pumping event. The 1,206-minute mark during recovery is about 12 hours after the end of the final Well 1 pumping event, when the effects of that event on Well 3 would have largely dissipated. The recovery value of 26.46 feet represents 99.8% of the original drawdown of 26.51 feet. By this measure, the recovery performance of Well 3 was quite good.

The purpose of Figure 11 is to compare the trend of the recovery curve with the drawdown curve on a graph with a log time scale. In this graph, the recovery data has been adjusted by inverting the curve about a horizontal axis and then offsetting the curve by an arbitrary amount to make the recovery curve match the drawdown curve as closely as possible. The "noise" introduced by the Well 1 pumping events makes the match less than perfect, but it is still clear that the rate at which the water level rebounded from pumping closely follows the rate of drawdown during the pumping period. By this measure, recovery performance appears good.

Figure 11 - Comparison of Well 3 Pumping & Adjusted Recovery

180-Day Projection - Figure 12 is a 180-day projection of the water level trend that prevailed near the end of the pumping period, during the hours just before the start of the final Well 1 pumping cycle. If the trend that existed at the end of the test persisted during six months of pumping at 300 gpm, the water level would be expected to reach 49.4 feet below the measuring point, amounting to drawdown of about 32 feet. The top of the screen is at 124 feet below the measuring point (120 feet below ground), and available drawdown is about 107 feet. Thus, six months of continuous pumping at 300 gpm would be expected to consume only 30% of available drawdown. Typically we require that a 180-day projection would indicate that no more than about two-thirds of available drawdown would be consumed. Consequently, 300 gpm can be considered to represent a conservative safe yield for Well 3.

Other Wells - Figures 13, 14, and 15 are graphs of water level vs. time for Well BRTW-1, the sanding well, and Well BRTW-2, respectively.

Well BRTW-1, which at five feet away was the monitored well closest to Well 1, showed the greatest impact from Well 1 pumping cycles. The transducer in BRTW-1 was set at a depth of about 37.5 feet, which turned out to be shallower than the water level during Well 1 pumping events. Consequently, Figure 13 shows only a fraction of the drawdown that occurred in response to the six Well 1 pumping cycles that occurred during the ambient conditions monitoring period. Well BRTW-1 water levels were measured manually during the Well 1 pumping cycle that took place in the first part of the Well 3 pumping period. The BRTW-1 water level was 15.15 feet just before the Well 1 pump came on, and the water level then fell to about 60 feet. Therefore, Well 1 pumping cycles produce about 45 feet of drawdown in BRTW-1. The 72-hour test of Well 3 produced a total of 5.75 feet of drawdown in BRTW-1.

The final Well 1 pumping cycle began roughly two hours before the end of the Well 3 pumping period (Table 2). As it happened, the BRTW-1 transducer was being reset during the first hour of the Well 1 cycle, so data from that time period was missed. However, Figure 13 shows water levels beginning to recover after the Well 3 pump was shut down. After about 7.5 hours of recovery from the Well 3 test, Well 1 also shut down, producing the final steep rebound of the water level (which began at the 4,778-minute mark).

The sanding well is 11 feet from Well 1, and 360 feet from Well 3. Each Well 1 pumping event produced about 10 feet of drawdown at the sanding well. The Well 3 test produced 5.78 feet of drawdown by the end of the pumping period, excluding data from the last two hours when Well 1 was pumping (Figure 14).

Well BRTW-2 is 95 feet from Well 1 and 328 feet from Well 3. Well 1 pumping events produce about 2.7 feet of drawdown at BRTW-2. The Well 3 test produced a maximum of 6.0 feet of drawdown at BRTW-2. Note also that the background water level rose by about 0.4 feet between days six and eight of the ambient conditions period, in response to the precipitation event. Similar responses are seen in BRTW-1 and the sanding well, but the responses are less obvious in the graphs for those wells because the range of the vertical scales is larger.

Aquifer Parameters - Aquifer parameters were estimated with the Jacob analytical method, using time-drawdown data from the pumping period at the sanding well. These results should be given limited weight, because the situation fails to satisfy assumptions of the Jacob method. In particular, the sanding well (which is nominally a bedrock well) is not completed in the same aquifer layer as Well 3. Nonetheless, the results can be considered to provide at least a rough estimate of aquifer properties. The method produces a transmissivity of about 4,100 ft²/day. If the aquifer thickness is taken as 43 feet (see Figure 3), the hydraulic conductivity is 95 ft/day. Storativity is 0.001, a reasonable value for a confined aquifer.

Shallow Piezometer and Staff Gage - No pumping-related impacts are recognized in the water level in shallow piezometer PZ-1 (Table 3). The water level remained near ground surface throughout the pumping period. The variation seen between readings may be mostly a function of the difficulty of getting accurate measurements in a situation where the top of the water column in the piezometer was often frozen. As noted above, before the first reading could be made on each day of the test, it was necessary to heat a steel rod with a propane torch to melt the ice plug that had formed in the upper part of the pipe. Even after the ice plug had been melted, the water in the tube was somewhat slushy, making it difficult to get reliable readings.

Table 4 shows water levels at staff gage SG-1. As noted above, water levels in the stream at the site of the staff gage could have been influenced by a downstream beaver pond that also received drainage from the pond beside the wellfield. Therefore, the data in Table 4 should be treated with caution.

Table 4 shows that water levels varied within a small range during the pumping period. Subjectively, surface water levels appeared stable during the pumping period. This would be consistent with the observed weather. The temperature remained continuously below the freezing mark beginning three days before the start of pumping, and continuing through the end of the recovery period, and there would be no reason to expect substantial surface water changes under these conditions.

Table 4 ·	- Staff	Gage	SG-1
-----------	---------	------	------

Performance of Well 1 - The impact of Well 1 pumping events on the surrounding wells has already been discussed, but it is possible to make additional comments on the well's current characteristics based on data collected during the monitoring period for the Well 3 test. Figure 16 is a distance-drawdown diagram based on data collected at the end of one of the Well 1 pumping periods. Well 1 water levels were not monitored during the test, so the drawdown value of 83 feet is an estimate based on the trend defined by measured water levels in BRTW-1 and BRTW-2. These two wells were chosen because they are both bedrock wells, and should be the available monitoring points most appropriate to represent water levels in the fractured-bedrock aquifer. It has been speculated that the water level in the sanding well may be controlled or strongly influenced by the basal sand aquifer, and Well 3 itself is of course completed in the basal sand, so these points were ignored in drawing the trendline of Figure 16.

It should be kept in mind that the trendline connecting BRTW-1 and BRTW-2 may give only a rough approximation of drawdown in Well 1. Any hydraulic inefficiency in that well would result in drawdown greater than that implied by the drawdown trend in neighboring bedrock wells, and in any event, distance-drawdown trends in bedrock aquifers are not necessarily linear. Nonetheless, the drawdown estimated for Well 1 is considered reasonable. Given drawdown of 83 feet, and the indicated flow rate of 141 gpm, the specific capacity of Well 1 after nine hours of pumping would be about 1.7 gpm/ft.

Figure 16 - Well 1 Distance-Drawdown at End of Pumping Cycle

Well 1 was subjected to a 72-hour test in 2006. That test was conducted at a rate of 221 gpm, and drawdown at the end of the test was 27.5 feet. This results in a 72-hour specific capacity of about 8.0 gpm/ft, much higher than the value estimated from the 2019 monitoring results. Though we do not know exactly how much drawdown occurred in Well 1 during the recent testing, it was clearly more than the 47.43 feet of drawdown measured in BRTW-1. Therefore, it is obvious that Well 1 is much less productive now than it was in 2006.

The main water-bearing fracture that was recognized in Well 1 was at a depth of 138 to 140 feet. The well's total depth is 270 feet. One possible explanation for the well's lower productivity is that the bottom of the well has filled in with sediment sufficient to cover the productive fractures. A second possibility is that the fractures themselves have become partially clogged. Whatever the explanation, the Town may want to get the problem diagnosed with the expectation of redeveloping the well after Well 3 goes online.

Revised WHPA - The Preliminary Report included a preliminary version of the Well 3 Wellhead Protection Area (WHPA) that was based on the assumption that the cone of depression associated with the proposed withdrawal would have a radius of 1,000 feet. Data generated during the Well 3 test indicates that the cone of depression associated with a pumping rate of 300 gpm should be more extensive. Figure 17 is a distance-drawdown graph based on 180-day projections of end-of-test trends in Well 3, BRTW-1, BRTW-2, and the sanding well. The graph indicates that the zero-drawdown distance after 180 days of pumping at 300 gpm would be 2,250 feet.

It should be pointed out that the available data set has a few weaknesses that limit its appropriateness for characterizing the Well 3 cone of depression. One weakness is that all three non-pumping wells are at a similar distance from Well 3, and they all plot at approximately the same point on the graph. This means that the distance-drawdown trendline is defined by only two points, the cluster of non-pumping wells, and Well 3 itself. Ideally, the point representing

Well 3 would not be used at all, because drawdown at that point has two components: the aquifer response, plus inefficiency associated with the pumping well.

Figure 17 - Well 3 Projected 180-Day Distance-Drawdown

A second weakness is that all three non-pumping wells are offset in roughly the same direction from Well 3. Consequently, the distance-drawdown relationship is defined only in one direction.

Finally, Well 3 taps the basal sand aquifer. The other three wells are bedrock wells, though it is suspected that the sanding well in particular may have a close connection with the unconsolidated sedimentary aquifer.

Despite these weaknesses, we assume the distance-drawdown graph still represents an adequate foundation for WHPA delineation.

Figure 18 shows the revised WHPA, along with sites in the contaminant source inventory. The revised WHPA is little changed from the original one. The 2,250-foot radius has been plotted on Figure 18. In drawing the WHPA, a decision was made to consider Johns Brook and the East Fork of the Ausable River as hydraulic boundaries. Therefore, areas within the radius that fall on the north side of Johns Brook, and on the east side of the river, are excluded from the WHPA. The WHPA has been drawn to include the upgradient areas southwest of the cone of depression. It takes in the topographic basin defined by Rooster Comb, Hedgehog Mountain, and Snow Mountain.

The WHPA contains few potential contaminant sources. The uplands areas are mostly wild forested land. Table 5 is a list of petroleum storage tank sites, repeated from the Preliminary Report and based on a query of the NYSDEC database. Table 6 is a list of spills, also from the NYSDEC database, and also repeated from the Preliminary Report. Moreover, the great thickness of lakebed clay at the well site should provide a good measure of protection from contaminant releases at the surface.

Water Quality - Water samples for lab analysis were collected in the final minutes of the 72hour test. The samples were analyzed for parameters on the NYSDOH Part 5 list, with the exception of the following "waiver list" parameters: diquat, endothall, glyphosate, and dioxin. The samples were analyzed by Endyne in Plattsburgh, and the lab report is in Appendix C.

Results for a few key parameters are provided in Table 7. Overall, water quality appears very good. No parameter exceeded a Primary Maximum Contaminant Level (PMCL). There were no detections for any parameters in the volatile organic categories. Bacteriological parameters were nondetects. Radiological parameters were below acceptable limits. The concentration of total dissolved solids, at 86 mg/l, was comparatively low. Hardness, at 60 mg/l, was well below the boundary between "soft" and "hard" water. Levels of the common "nuisance" parameters iron and manganese were below their respective Secondary Maximum Contaminant Levels (SMCL).

Parameter	Result	Units

Table 7 - Water Quality Summary

GUIDI Assessment - An MPA (multiparticulate analysis) test was run during the final 24 hours of the pumping test. Analysis of the filter sample was done by CH Diagnostics, and the lab report is included in Appendix C. The lab, using the scoring protocol of the EPA Consensus Method for the analysis, reported a score of zero, indicating a low probability of surface water influence.

As a companion to the MPA test, field analysis of paired samples of surface water and Well 3 discharge water was done several times a day for pH, total dissolved solids, specific conductance, and temperature. The surface water samples were collected near the staff gage. The results are shown in Table 7. Examination of the table shows that there was no tendency for the characteristics of the water pumped from Well 3 to become more like the nearby surface water. Taken together, the MPA analysis and GUIDI screening results indicate a low risk that Well 3 would be under the influence of surface water. This is consistent with the site geology, given that the basal sand-and-gravel aquifer is capped by roughly 100 feet of fine-grained glacial lakebed sediments.

Table 8 - GUIDI Screening

Conclusions and Recommendations

The 72-hour pumping test indicates that 300 gpm is a reasonable safe, sustainable yield for Well 3. Natural water quality appears very good. The WHPA associated with the well includes few contaminant threats, and the thick layer of lakebed sediments capping the basal gravel aquifer should offer protection from contaminant releases near the well.

Observations made during the Well 3 72-hour test indicate that the specific capacity of Well 1 is much lower than it was when the well was installed. After Well 3 goes into service, it would be prudent for the Town to check out the condition of Well 1 with the expectation that redevelopment or other action may allow restoration of some of the well's lost productivity.

APPENDIX C Lab Reports

Laboratory Report

Hydrosource Associates, Inc 201114

50 Winter St

Ashland, NH 03217

Atten: Christine Rowell

PROJECT: Well 3 - Keene Valley Part 5
WORK ORDER: 1901-02208
DATE RECEIVED: January 31, 2019
DATE REPORTED: February 28, 2019
SAMPLER: Loring S

Enclosed please find the results of the analyses performed for the samples referenced on the attached chain of custody located at the end of this report.

The column labeled Lab/Tech in the accompanying report denotes the laboratory facility where the testing was performed and the technician who conducted the assay. A "W" designates the Williston, VT lab under NELAC certification ELAP 11263; "R" designates the Lebanon, NH facility under certification NH 2037 and "N" the Plattsburgh, NY lab under certification ELAP 11892. "Sub" indicates the testing was performed by a subcontracted laboratory. The accreditation status of the subcontracted lab is referenced in the corresponding NELAC and Qual fields.

This NELAC column also denotes the accreditation status of each laboratory for each reported parameter. "A" indicates the referenced laboratory is NELAC accredited for the parameter reported. "N" indicates the laboratory is not accredited. "U" indicates that NELAC does not offer accreditation for that parameter in that specific matrix. Test results denoted with an "A" meet all National Environmental Laboratory Accreditation Program requirements except where denoted by pertinent data qualifiers. Test results are representative of the samples as they were received at the laboratory.

Endyne, Inc. warrants, to the best of its knowledge and belief, the accuracy of the analytical test results contained in this report, but makes no other warranty, expressed or implied, especially no warranties of merchantability or fitness for a particular purpose.

Report Summary of Qualifiers and Notes

E: Sample was analyzed past Method specified holding time.

Samples received in this project required pH. The EPA hold time for this analysis is 15 minutes and should be performed at the time of collection. Analysis was performed as soon as possible upon arrival at the laboratory.

E1: Sample was received past Method specified holding time at the subcontract lab due to a snowfall/ weather event in Buffalo NY.

EMSL: This analysis was subcontracted to EMSL Laboratories, ELAP#11606. A copy of the results report has been attached for your reference.

SMB: Analysis performed by subcontracted laboratory, Microbac Laboratory Inc. Dayville, CT, VT/NH/NY 11549. Results are presented here for your convenience. Refer to the complete subcontracted report, which has been appended to this report, for detailed information regarding this result.

J: Reported value has a higher level of uncertainty. The reported value was above the Method Detection Limit but below the lowest point in the calibration. A value above the MDL has a 99% confidence that the concentration of the parameter in the sample is greater than zero.

SPA: Analysis performed by subcontracted laboratory, Pace Analytical, with the following state assigned laboratory ID numbers; VT0282, NY10888, NH2974. Refer to the complete subcontracted report appended to this report, for detailed information regarding this result.

Test results comply with all NELAC requirements unless otherwise noted. This Laboratory Report includes the client's COC sample documentation and shall not be reproduced except in full, without written approval of the laboratory.

Pace Analytical Services, LLC 1638 Roseytown Road - Suites 2,3,4 Greensburg, PA 15601 (724)850-5600

February 27, 2019

Chris Lafountain Endyne, Inc. - NY 315 New York Road Plattsburgh, NY 12901

RE: Project: 1901-02208 Pace Project No.: 30279005

Dear Chris Lafountain:

Enclosed are the analytical results for sample(s) received by the laboratory on February 06, 2019. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Laura tilla

Laura M. Pirilla laura.pirilla@pacelabs.com (724)850-5616 Project Manager

 Pace Project No.:
 30279005

Method:EPA 900.0Description:900.0 Gross Alpha/BetaClient:Endyne Inc. NYDate:February 27, 2019

General Information:

1 sample was analyzed for EPA 900.0. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:

All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

QUALIFIERS

Project: 1901-02208 Pace Project No.: 30279005

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Act - Activity

Unc - Uncertainty: For Safe Drinking Water Act (SDWA) analyses, the reported Unc. Is the calculated Count Uncertainty (95% confidence interval) using a coverage factor of 1.96. For all other matrices (non-SDWA), the reported Unc. is the calculated Expanded Uncertainty (aka Combined Standard Uncertainty, CSU), reported at the 95% confidence interval using a coverage factor of 1.96.

Gamma Spec: The Unc. reported for all gamma-spectroscopy analyses (EPA 901.1), is the calculated Expanded Uncertainty (CSU) at the 95.4% confidence interval, using a coverage factor of 2.0.

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

APPENDIX B

APA SHORELINE RESTRICTIONS

SHORELINE RESTRICTIONS

This is a supplement to the Citizen's Guide, which provides basic information about Adirondack Park Agency regulations.

Pursuant to §806 of the Adirondack Park Agency Act, the following restrictions apply regardless of whether an Agency permit is required for a new land use or development or subdivision.¹ Additional restrictions may also apply to the shoreline of rivers included in the New York State Wild, Scenic, and Recreational River System.

STRUCTURE SETBACKS (these setbacks do not apply to docks and boathouses; see below)

Any new structure² exceeding 100 square feet in size must comply with the following minimum setback distances from the mean high water mark (the average annual high water level) of any lake or pond or any river or stream navigable by boat, including canoe:

Hamlet	50 feet	Rural Use	75 feet
Moderate Intensity Use	50 feet	Resource Management	100 feet
Low Intensity Use	75 feet		

Structures that are only partially located within the setback, as well as individual structures that are attached to each other, are measured in their entirety for the purpose of implementing these restrictions.³ The setback is measured horizontally along the shortest line between any point of the structure and any point on the shoreline at the mean high water mark. The Agency will locate the mean high water mark upon request of any landowner contemplating development.

Structures that lawfully exist within a shoreline setback area may be replaced or rebuilt in the same location or immediate vicinity. Effective December 31, 2008, the following changes to the dimensions of a lawfully existing structure within the setback area require a variance, whether the changes occur through expansion or replacement: (i) location of the structure any closer to the mean high water mark; (ii) any increase in height; (iii) any increase in footprint; or (iv) any increase in width. However, an increase of up to two feet in height of a single family dwelling or mobile home⁴, an increase of up to 250 square feet of footprint to the rear (non-shoreline side) of a single family dwelling or mobile home, and/or the addition of a stoop no larger than 25 square feet providing access to the rear or side of a single family dwelling or mobile home does

¹ The shoreline restrictions of APA Act §806 are incorporated in the Agency-approved local zoning program for the Towns of Arietta, Bolton, Caroga, Chester, Chesterfield, Colton, Day, Edinburg, Hague, Horicon, Indian Lake, Johnsburg, Newcomb, Queensbury, Westport, and Willsboro, and the Town and Village of Lake George. Advice on requirements and variance procedures may be obtained from the local code enforcement officer.

² The term structure includes decks, stairways, porches, sheds, fences, picnic shelters, cabins, lean-tos, etc. Motor vehicles and trailers that are registered with the DMV, have a current inspection sticker, and are not connected to an in-ground wastewater treatment system are generally not considered structures subject to the setback requirements.

³ Structures may be considered attached for Agency purposes if they are less than ten feet apart or structurally integrated. However, stairways, patios, walkways, docks, and boathouses are considered individual structures for replacement purposes, regardless of their attachment to other structures. Please contact the Agency for more information.

⁴ For the purpose of implementing 9 NYCRR ' 575.5, the height of buildings with roof ridgeline(s) is measured at the highest point of the highest roof ridgeline. The height of buildings without roof ridgeline(s) is measured at the highest point of the structure.

not require a variance. There are minor expansions allowed for other types of lawfully existing shoreline structures, as well; please contact the Agency for more information.

No variance is required for any replacement or expansion undertaken outside the shoreline setback area.

DOCKS AND BOATHOUSES

A structure that constitutes a dock or boathouse pursuant to the definitions referenced below is not subject to the shoreline setback requirements.

Dock is defined under §570.3(j) of Agency regulations. In general, a dock is a floating or fixed structure that is no more than eight feet in width, including at its attachment to a shoreline or boathouse, and could be used for securing and/or loading or unloading water craft and/or for swimming or water recreation. A structure that meets this definition is considered a dock below the mean high water mark and a boardwalk, deck, or other structure upland of the mean high water mark. Docks that are hoisted or suspended above water level for storage must conform to additional parameters.

Boathouse is defined under §570.3(c) of Agency regulations. In general, a boathouse is a covered structure with direct access to a body of water that is used only for the storage of boats and associated equipment, does not contain sanitary plumbing of any kind, does not exceed a single story in that the roof rafters rest on the top plate of the first floor wall, and has a footprint of 1200 square feet or less and a height of fifteen feet or less. The footprint of a boathouse is measured at the exterior walls, or at the perimeter of the roof if the roof is flat or there are no exterior walls. The height of a boathouse is measured from the surface of the floor serving the boat berths to the highest point of the structure. A structure within the Lake George Park may be a boathouse even if it does not meet this definition, provided the structure is in compliance with a permit from the Lake George Park Commission.

MINIMUM LOT WIDTHS

Any subdivision creating a new parcel on which a new principal building will be constructed must comply with the following lot widths, as measured along the shoreline at the mean high water mark. This standard applies even when no Agency permit is required for the subdivision.

Hamlet	50 feet	Rural Use	150 feet
Moderate Intensity Use	100 feet	Resource Management	200 feet
Low Intensity Use	125 feet		

Additional shoreline lot width may be required for (i) providing deeded or contractual access to water bodies and (ii) the creation of lots in designated Scenic and Recreational River areas.

SEWAGE SYSTEM SETBACKS

Any new leaching facility (including a seepage pit, drainage field, outhouse, or pit privy) receiving any form of household effluent must be set back at least 100 feet from any water body, including an intermittent stream with a defined bed and bank. The setback is measured horizontally along the shortest distance from the mean high water mark to the closest point of the leaching facility. New York State Department of Health standards also require that the absorption field (leaching facility) of any new on-site sewage disposal system be installed at least 100 feet from the source of any water supply system. Alteration or replacement of a lawfully existing leaching facility located within 100 feet of a water body must occur in conformance with the setback requirements to the greatest extent possible, with the leaching facility located no closer to the mean high water mark, and must provide enhanced treatment.

Upon the expansion of any structure to allow for an actual or potential increase in occupancy, the leaching facility serving the structure must be located at least 100 feet from all water bodies.

SHORELINE CUTTING RESTRICTIONS

Except to allow for the removal of diseased vegetation and rotten or damaged trees, all vegetative cutting on a parcel with shoreline on a lake, pond, or navigable river or stream must comply with the following restrictions:

- (a) Within 35 feet of the mean high-water mark, no more than 30 percent of the <u>trees</u> in excess of six inches diameter at breast height (4½ feet above ground) may be cut over any 10-year period.
- (b) Within 6 feet of the mean high-water mark, no more than 30 percent of <u>any</u> <u>vegetation</u> may be removed.

This flyer is intended to provide general information regarding Agency jurisdiction. Other provisions or restrictions may apply if an Agency permit or variance is required or if the property has previously been subject to Agency review.

Please contact the Agency with any questions at 518-891-4050. For a binding written response as to whether a specific proposal requires Agency review, please submit a Jurisdictional Inquiry Form (JIF). The JIF form is available on the Agency website at www.apa.ny.gov/Forms/jiform.pdf.

APPENDIX C

ENVIRONMENTAL FACT SHEETS & RESOURCES

IPaC

IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

Location

Clinton County, New York

Local office

New York Ecological Services Field Office

▶ (607) 753-9334
▶ (607) 753-9699

3817 Luker Road Cortland, NY 13045-9385

http://www.fws.gov/northeast/nyfo/es/section7.htm

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population, even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

- 1. Draw the project location and click CONTINUE.
- 2. Click DEFINE PROJECT.
- 3. Log in (if directed to do so).
- 4. Provide a name and description for your project.
- 5. Click REQUEST SPECIES LIST.

Listed species¹ and their critical habitats are managed by the <u>Ecological Services Program</u> of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries²).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact <u>NOAA Fisheries</u> for <u>species under their jurisdiction</u>.

- 1. Species listed under the <u>Endangered Species Act</u> are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the <u>listing status page</u> for more information.
- 2. <u>NOAA Fisheries</u>, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

Mammals

NAME

Endangered

Indiana Bat Myotis sodalis There is final critical habitat for this species. Your location is outside the critical habitat. <u>https://ecos.fws.gov/ecp/species/5949</u>

Threatened

Northern Long-eared Bat Myotis septentrionalis No critical habitat has been designated for this species. <u>https://ecos.fws.gov/ecp/species/9045</u>

Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

THERE ARE NO CRITICAL HABITATS AT THIS LOCATION.

Migratory birds

Certain birds are protected under the Migratory Bird Treaty Act^{1} and the Bald and Golden Eagle Protection Act^{2} .

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats should follow appropriate regulations and consider implementing appropriate conservation measures, as described <u>below</u>.

- 1. The Migratory Birds Treaty Act of 1918.
- 2. The <u>Bald and Golden Eagle Protection Act</u> of 1940.

Additional information can be found using the following links:

- Birds of Conservation Concern http://www.fws.gov/birds/management/managed-species/birds-of-conservation-concern.php
- Measures for avoiding and minimizing impacts to birds <u>http://www.fws.gov/birds/management/project-assessment-tools-and-guidance/</u> <u>conservation-measures.php</u>
- Nationwide conservation measures for birds <u>http://www.fws.gov/migratorybirds/pdf/management/nationwidestandardconservationmeasures.pdf</u>

The birds listed below are birds of particular concern either because they occur on the <u>USFWS Birds</u> of <u>Conservation Concern</u> (BCC) list or warrant special attention in your project location. To learn more about the levels of concern for birds on your list and how this list is generated, see the FAQ <u>below</u>. This is not a list of every bird you may find in this location, nor a guarantee that every bird on this list will be found in your project area. To see exact locations of where birders and the general public have sighted birds in and around your project area, visit the <u>E-bird data mapping tool</u> (Tip: enter your location, desired date range and a species on your list). For projects that occur off the Atlantic Coast, additional maps and models detailing the relative occurrence and abundance of bird

species on your list are available. Links to additional information about Atlantic Coast birds, and other important information about your migratory bird list, including how to properly interpret and use your migratory bird report, can be found <u>below</u>.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NAME

BREEDING SEASON (IF A BREEDING SEASON IS INDICATED FOR A BIRD ON YOUR LIST, THE BIRD MAY BREED IN YOUR PROJECT AREA SOMETIME WITHIN THE TIMEFRAME SPECIFIED, WHICH IS A VERY LIBERAL ESTIMATE OF THE DATES INSIDE WHICH THE BIRD BREEDS ACROSS ITS ENTIRE RANGE. "BREEDS ELSEWHERE" INDICATES THAT THE BIRD DOES NOT LIKELY BREED IN YOUR PROJECT AREA.)

Breeds May 20 to Jul 31

Bobolink Dolichonyx oryzivorus

This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read and understand the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

- The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
- 2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence

across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.

3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

Breeding Season (=)

Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort ()

Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

No Data (–)

A week is marked as having no data if there were no survey events for that week.

Survey Timeframe

Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

Tell me more about conservation measures I can implement to avoid or minimize impacts to migratory birds.

<u>Nationwide Conservation Measures</u> describes measures that can help avoid and minimize impacts to all birds at any location year round. Implementation of these measures is particularly important when birds are most likely to occur in the project area. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is a very helpful impact minimization measure. To see when birds are most likely to occur and be breeding in your project area, view the Probability of Presence Summary. <u>Additional</u> <u>measures</u> and/or <u>permits</u> may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the migratory birds potentially occurring in my specified location?

The Migratory Bird Resource List is comprised of USFWS <u>Birds of Conservation Concern (BCC)</u> and other species that may warrant special attention in your project location.

7/11/2019

IPaC: Explore Location

The migratory bird list generated for your project is derived from data provided by the <u>Avian Knowledge</u> <u>Network (AKN)</u>. The AKN data is based on a growing collection of <u>survey, banding, and citizen science datasets</u> and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (<u>Eagle Act</u> requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the <u>AKN Phenology Tool</u>.

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

The probability of presence graphs associated with your migratory bird list are based on data provided by the <u>Avian Knowledge Network (AKN</u>). This data is derived from a growing collection of <u>survey, banding, and citizen</u> <u>science datasets</u>.

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

How do I know if a bird is breeding, wintering, migrating or present year-round in my project area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating or year-round), you may refer to the following resources: <u>The Cornell Lab of Ornithology All About Birds Bird Guide</u>, or (if you are unsuccessful in locating the bird of interest there), the <u>Cornell Lab of Ornithology Neotropical Birds</u> <u>guide</u>. If a bird on your migratory bird species list has a breeding season associated with it, if that bird does occur in your project area, there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

- 1. "BCC Rangewide" birds are <u>Birds of Conservation Concern</u> (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);
- 2. "BCC BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
- 3. "Non-BCC Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the <u>Eagle Act</u> requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to try to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially eagles and BCC species of rangewide concern. For more information on conservation measures you can implement to help avoid and minimize migratory bird impacts and requirements for eagles, please see the FAQs for these topics.

Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the <u>Northeast Ocean Data Portal</u>. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the <u>NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and</u> <u>Abundance on the Atlantic Outer Continental Shelf</u> project webpage.

Bird tracking data can also provide additional details about occurrence and habitat use throughout the year, including migration. Models relying on survey data may not include this information. For additional information on marine bird tracking data, see the <u>Diving Bird Study</u> and the <u>nanotag studies</u> or contact <u>Caleb Spiegel</u> or <u>Pam</u> <u>Loring</u>.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to <u>obtain a permit</u> to avoid violating the Eagle Act should such impacts occur.

Proper Interpretation and Use of Your Migratory Bird Report

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated, and see options for identifying what other birds may be in your project area, please see the FAQ "What does IPaC use to generate the migratory birds potentially occurring in my specified location". Please be aware this report provides the "probability of presence" of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please also look carefully at the survey effort (indicated by the black vertical bar) and for the existence of the "no data" indicator (a red horizontal bar). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list helps you know what to look for to confirm presence, and helps guide you in knowing when to implement conservation measures to avoid or minimize potential impacts from your project activities, should presence be confirmed. To learn more about conservation measures, visit the FAQ "Tell me about conservation measures I can implement to avoid or minimize impacts to migratory birds" at the bottom of your migratory bird trust resources page.

Facilities

National Wildlife Refuge lands

Any activity proposed on lands managed by the <u>National Wildlife Refuge</u> system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

THERE ARE NO REFUGE LANDS AT THIS LOCATION.

Fish hatcheries

THERE ARE NO FISH HATCHERIES AT THIS LOCATION.

rATIC

Wetlands in the National Wetlands Inventory

Impacts to <u>NWI wetlands</u> and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local <u>U.S. Army Corps of</u> <u>Engineers District</u>.

Please note that the NWI data being shown may be out of date. We are currently working to update our NWI data set. We recommend you verify these results with a site visit to determine the actual extent of wetlands on site.

This location overlaps the following wetlands:

FRESHWATER FORESTED/SHRUB WETLAND

<u>PFO1E</u> <u>PFO1F</u>

FRESHWATER POND

<u>PUBHx</u>

RIVERINE

<u>R5UBH</u>

A full description for each wetland code can be found at the National Wetlands Inventory website

Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this https://ecos.fws.gov/ipac/location/XDKZ5A54RZBZLPAIM6LZ6DHMB4/resources

7/11/2019

IPaC: Explore Location

inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

OTFORCONSULTATIO

Northern Long-Eared Bat

Myotis septentrionalis

The northern long-eared bat is federally listed as a threatened species under the Endangered Species Act. *Endangered* species are animals and plants that are in danger of becoming extinct. *Threatened* species are animals and plants that are likely to become endangered in the foreseeable future. Identifying, protecting and restoring endangered and threatened species is the primary objective of the U.S. Fish and Wildlife Service's Endangered Species Program.

What is the northern long-eared bat?

Appearance: The northern longeared bat is a medium-sized bat with a body length of 3 to 3.7 inches and a wingspan of 9 to 10 inches. Their fur color can be medium to dark brown on the back and tawny to pale-brown on the underside. As its name suggests, this bat is distinguished by its long ears, particularly as compared to other bats in its genus, *Myotis*.

Winter Habitat: Northern long-eared bats spend winter hibernating in caves and mines, called hibernacula. They use areas in various sized caves or mines with constant temperatures, high humidity, and no air currents. Within hibernacula, surveyors find them hibernating most often in small crevices or cracks, often with only the nose and ears visible.

Summer Habitat: During the summer, northern long-eared bats roost singly or in colonies underneath bark, in cavities or in crevices of both live trees and snags (dead trees). Males and non-reproductive females may also roost in cooler places, like caves and mines. Northern longeared bats seem to be flexible in selecting roosts, choosing roost trees based on suitability to retain bark or provide cavities or crevices. They rarely roost in human structures like barns and sheds.

Reproduction: Breeding begins in late summer or early fall when males begin to swarm near hibernacula. After

This northern long-eared bat, observed during an Illinois mine survey, shows visible symptoms of white-nose syndrome.

copulation, females store sperm during hibernation until spring. In spring, females emerge from their hibernacula, ovulate and the stored sperm fertilizes an egg. This strategy is called delayed fertilization.

After fertilization, pregnant bats migrate to summer areas where they roost in small colonies and give birth to a single pup. Maternity colonies of females and young generally have 30 to 60 bats at the beginning of the summer, although larger maternity colonies have also been observed. Numbers of bats in roosts typically decrease from the time of pregnancy to post-lactation. Most bats within a maternity colony give birth around the same time, which may occur from late May or early June to late July, depending where the colony is located within the species' range. Young bats start flying by 18 to 21 days after birth. Maximum lifespan for the northern longeared bat is estimated to be up to 18.5 years.

Feeding Habits: Like most bats, northern long-eared bats emerge at dusk to feed. They primarily fly through the

understory of forested areas feeding on moths, flies, leafhoppers, caddisflies, and beetles, which they catch while in flight using echolocation or by gleaning motionless insects from vegetation.

Range: The northern long-eared bat's range includes much of the eastern and north central United States, and all Canadian provinces from the Atlantic Ocean west to the southern Yukon Territory and eastern British Columbia. The species' range includes 37 States and the District of Columbia: Alabama, Arkansas, Connecticut, Delaware, Georgia, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Montana, Nebraska, New Hampshire, New Jersey, New York, North Carolina, North Dakota, Ohio, Oklahoma, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Vermont, Virginia, West Virginia, Wisconsin, and Wyoming.

Why is the northern long-eared bat in trouble?

White-nose Syndrome: No other threat is as severe and immediate as

this. If this disease had not emerged, it is unlikely that northern long-eared bat populations would be experiencing such dramatic declines. Since symptoms were first observed in New York in 2006, white-nose syndrome has spread rapidly from the Northeast to the Midwest and Southeast; an area that includes the core of the northern long-eared bat's range, where it was most common before this disease. Numbers of northern longeared bats (from hibernacula counts) have declined by up to 99 percent in the Northeast. Although there is uncertainty about the rate that white-nose syndrome will spread throughout the species' range, it is expected to continue to spread throughout the United States in the foreseeable future.

Other Sources of Mortality:

Although no significant population declines have been observed due to the sources of mortality listed below, they may now be important factors affecting this bat's viability until we find ways to address WNS.

Impacts to Hibernacula: Gates or other structures intended to exclude people from caves and mines not only restrict bat flight and movement, but also change airflow and microclimates. A change of even a few degrees can make a cave unsuitable for hibernating bats. Also, cave-dwelling bats are vulnerable to human disturbance while hibernating. Arousal during hibernation causes bats to use up their energy stores, which may lead to bats not surviving through winter.

Loss or Degradation of Summer

Habitat: Highway construction, commercial development, surface mining, and wind facility construction permanently remove habitat and are activities prevalent in many areas of this bat's range. Many forest management activities benefit bats by keeping areas forested rather than converted to other uses. But, depending on type and timing, some forest management activities can cause mortality and temporarily remove or degrade roosting and foraging habitat.

Wind Farm Operation: Wind turbines kill bats, and, depending on the species, in very large numbers. Mortality from windmills has been documented for northern long-eared bats, although a

small number have been found to date. However, there are many wind projects within a large portion of the bat's range and many more are planned.

What Is Being Done to Help the Northern Long-Eared Bat? *Disease Management:* Actions have

been taken to try to reduce or slow the spread of white-nose syndrome through human transmission of the fungus into caves (e.g. cave and mine closures and advisories; national decontamination protocols). A national plan was prepared by the Service and other state and federal agencies that details actions needed to investigate and manage white-nose syndrome. Many state and federal agencies, universities and non-governmental organizations are researching this disease to try to control its spread and address its affect. See www.whitenosesvndrome. org/ for more.

Addressing Wind Turbine

Mortality: The Service and others are working to minimize bat mortality from wind turbines on several fronts. We fund and conduct research to determine why bats are susceptible to turbines. how to operate turbines to minimize mortality and where important bird and bat migration routes are located. The Service, state natural resource agencies, and the wind energy industry are developing a Midwest Wind Energy Habitat Conservation Plan, which will provide wind farms a mechanism to continue operating legally while minimizing and mitigating listed bat mortality.

Listing: The northern long-eared bat is listed as a threatened species under the federal Endangered Species Act. Listing a species affords it the protections of the Act and also increases the priority of the species for funds, grants, and recovery opportunities.

Hibernacula Protection: Many federal and state natural resource agencies and conservation organizations have protected caves and mines that are important hibernacula for cave-dwelling bats.

What Can I Do? *Do Not Disturb Hibernating Bats:*

To protect bats and their habitats, comply with all cave and mine closures, advisories, and regulations. In areas without a cave and mine closure policy, follow approved decontamination protocols (see http://whitenosesyndrome. org/topics/decontamination). Under no circumstances should clothing, footwear, or equipment that was used in a whitenose syndrome affected state or region be used in unaffected states or regions.

Leave Dead and Dying Trees

Standing: Like most eastern bats, the northern long-eared bat roosts in trees during summer. Where possible and not a safety hazard, leave dead or dying trees on your property. Northern long-eared bats and many other animals use these trees.

Install a Bat Box: Dead and dying trees are usually not left standing, so trees suitable for roosting may be in short supply and bat boxes may provide additional roost sites. Bat boxes are especially needed from April to August when females look for safe and quiet places to give birth and raise their pups.

Support Sustainability: Support efforts in your community, county and state to ensure that sustainability is a development goal. Only through sustainable living will we provide rare and declining species, like the northern longeared bat, the habitat and resources they need to survive alongside us.

Spread the Word: Understanding the important ecological role that bats play is a key to conserving the northern long-eared and other bats. Helping people learn more about the northern long-eared bat and other endangered species can lead to more effective recovery efforts. For more information, visit www.fws.gov/midwest/nleb and www.whitenosesyndrome.org

Join and Volunteer: Join a conservation group; many have local chapters. Volunteer at a local nature center, zoo, or national wildlife refuge. Many state natural resource agencies benefit greatly from citizen involvement in monitoring wildlife. Check your state agency websites and get involved in citizen science efforts in your area.

U.S. Fish & Wildlife Service

Threatened and Endangered Species

Indiana Bat *(Myotis sodalis)*

Town of Crown Point Collection System Evaluation Figure 2.10 USFWS Bat Fact Sheets

Indiana bats eat up to half their body weight in insects each night.

The Indiana bat is an endangered species. Endangered species are animals and plants that are in danger of becoming extinct. Threatened species are those that are likely to become endangered in the foreseeable future. Identifying, protecting, and restoring endangered and threatened species are primary objectives of the U.S. Fish and Wildlife Service's endangered species program.

What is the Indiana Bat? *Description*

The scientific name of the Indiana bat is *Myotis sodalis* and it is an accurate description of the species. Myotis means "mouse ear" and refers to the relatively small, mouse-like ears of the bats in this group. Sodalis is the Latin word for "companion." The Indiana bat is a very social species; large numbers cluster together during hibernation. The species is called the Indiana bat because the first specimen described to science in 1928 was based on a specimen found in southern Indiana's Wyandotte Cave in 1904.

The Indiana bat is quite small, weighing only one-quarter of an ounce (about the weight of three pennies). In flight, it has a wingspan of 9 to 11 inches. The fur is dark-brown to black. The Indiana bat is similar in appearance to many other related species. Biologists can distinguish it from similar species by comparing characteristics such as the structure of the foot and color variations in the fur.

Habitat

Indiana bats hibernate during winter in caves or, occasionally, in abandoned mines. For hibernation, they require cool, humid caves with stable temperatures, under 50° F but above freezing. Very few caves within the range of the species have these conditions. Hibernation is an adaptation for survival during the cold winter months when no insects are available for bats to eat. Bats must store energy in the form of fat before hibernating. During the six months of hibernation the stored fat is their only source of energy. If bats are disturbed or cave temperatures increase, more energy is needed and hibernating bats may starve.

After hibernation, Indiana bats migrate to their summer habitat in wooded areas where they usually roost under loose tree bark on dead or dying trees. During summer, males roost alone or in small groups, while females roost in larger groups of up to 100 bats or more. Indiana bats also forage in or along the edges of forested areas.

Reproduction

Indiana bats mate during fall before they enter caves to hibernate. Females store the sperm through winter and become pregnant in spring soon after they emerge from the caves. After migrating to their summer areas, females roost under the peeling bark of dead and dying trees in groups of up to 100 or more. Such groups are called maternity colonies. Each female in the colony gives birth to only one pup per year. Young bats are nursed by the mother, who leaves the roost tree only to forage for food. The young stay with the maternity colony throughout their first summer.

Feeding Habits

Indiana bats eat a variety of flying insects found along rivers or lakes and in uplands. Like all insect-eating bats, they benefit people by consuming insects that are considered pests or otherwise harmful to humans. Their role in insect control is not insignificant – Indiana bats eat up to half their body weight in insects each night.

Range

Indiana bats are found over most of the eastern half of the United States. Almost half of all Indiana bats (207,000 in 2005) hibernate in caves in southern Indiana. In 2005, other states which supported populations of over 40,000 included Missouri (65,000), Kentucky (62,000), Illinois (43,000) and New York (42,000). Other states within the current range of the Indiana bat include Alabama, Arkansas, Connecticut, Iowa, Maryland, Michigan, New Jersey, North Carolina, Ohio, Oklahoma, Pennsylvania, Tennessee, Vermont, Virginia, West Virginia. The 2005 population estimate is about 457,000 Indiana bats, half as many as when the species was listed as endangered in 1967.

Why is the Indiana Bat Endangered? *Human Disturbance*

Indiana bats, because they hibernate in large numbers in only a few caves, are extremely vulnerable to disturbance. During hibernation, they cluster in groups of up to 500 per square foot. Since the largest hibernation caves support from 20,000 to 50,000 bats, it is easy to see how a large part of the total population can be affected by a single event. Episodes of large numbers of Indiana bat deaths have occurred due to human disturbance during hibernation.

Cave Commercialization and Improper Gating

The commercialization of caves allowing visitors to tour caves during hibernation – drives bats away. Changes in the structure of caves, such as blocking an entrance, can change the temperature in a cave. A change of even a few degrees can make a cave unsuitable for hibernating bats. Some caves are fitted with gates to keep people out, but improper gating that prevents access by bats or alters air flow, temperature, or humidity can also be harmful. Properly constructed gates are beneficial because they keep people from disturbing hibernating bats while maintaining temperature and other requirements and allowing access for bats.

Summer Habitat Loss or Degradation

Indiana bats use trees as roosting and foraging sites during summer months.

Loss and fragmentation of forested habitats can affect bat populations.

Pesticides and Environmental Contaminants

Insect-eating bats may seem to have an unlimited food supply, but in local areas, insects may not be plentiful because of pesticide use. This can also affect the quality of the bats' food supply. Many scientists believe that population declines occurring today might be due, in part, to pesticides and environmental contaminants. Bats may be affected by eating contaminated insects, drinking contaminated water, or absorbing the chemicals while feeding in areas that have been recently treated.

What is Being Done to Prevent Extinction of the Indiana Bat? Listing

Prompted by declining populations caused by disturbance of bats during hibernation and modification of hibernacula, the Indiana bat was listed in 1967 as "in danger of extinction" under the Endangered Species Preservation Act of 1966. It is listed as "endangered" under the current Endangered Species Act of 1973. Listing under the Endangered Species Act protects the Indiana bat from take (harming, harassing, killing) and requires Federal agencies to work to conserve it.

Recovery Plan

The Endangered Species Act requires that recovery plans be prepared for all listed species. The U.S. Fish and Wildlife Service developed a recovery plan for the Indiana bat in 1983 and is now revising that Plan. The recovery plan describes actions needed to help the bat recover.

Habitat Protection

Public lands like National Wildlife Refuges, military areas, and U.S. Forest Service lands are managed for Indiana bats by protecting forests. This means ensuring that there are the size and species of trees needed by Indiana bats for roosting; and providing a supply of dead and dying trees that can be used as roost sites. In addition, caves used for hibernation are managed to maintain suitable conditions for hibernation and eliminate disturbance.

Education and Outreach

Understanding the important role played by Indiana bats is a key to conserving the species. Helping people learn more about the Indiana bat and other endangered species can lead to more effective recovery efforts.

APPENDIX D

ENGINEERING REPORT CERTIFICATION

Appendix C: Engineering Report Certification (required for EFC financial assistance)

Engineering Report Certification

To Be Provided by the Professional Engineer Preparing the Report

During the preparation of this Engineering Report, I have studied and evaluated the cost and effectiveness of the processes, materials, techniques, and technologies for carrying out the proposed project or activity for which assistance is being sought from the New York State Clean Water State Revolving Fund. In my professional opinion, I have recommended for selection, to the maximum extent practicable, a project or activity that maximizes the potential for efficient water use, reuse, recapture, and conservation, and energy conservation, taking into account the cost of constructing the project or activity, the cost of operating and maintaining the project or activity.

Title of Engineering Report: Town of Keene Water District #2 Well Field Evaluation

Date of Report: 08/29/2020

Professional Engineer's Name: Gregory Swart

Signature:

Date: 08/29/2020

APPENDIX E

SMART GROWTH ASSESSMENT

Smart Growth Assessment Form

This form should be completed by the applicant's project engineer or other design professional.¹

A	aa	lica	nt	Info	orma	ation

Applicant: Town of KeeneProject No.: 4893Project Name: Water District #2 Well Field EvaluationIs project construction complete? <a>Yes, date:Is No

Project Summary: (provide a short project summary in plain language including the location of the area the project serves) The project outlines the different proposed alternatives to supply the Town with a redundant investigate existing treatment processes to ensure the longevity of the disinfection process.

Section 1 – Screening Questions

1. Prior Approvals

1A. Has the project been previously approved for Environmental Fac Corporation (EFC) financial assistance?	cilities [⊐ Yes	🗹 No
1B. If so, what was the project number(s) for the prior Proj approval(s)?	ject No.:		
Is the scope of the project substantially the same as that which v approved?	was	□ Yes	🗆 No

IF THE PROJECT WAS PREVIOUSLY APPROVED BY EFC'S BOARD AND THE SCOPE OF THE PROJECT HAS NOT MATERIALLY CHANGED, THE PROJECT IS **NOT** SUBJECT TO SMART GROWTH REVIEW. SKIP TO SIGNATURE BLOCK.

2. New or Expanded Infrastructure

2A.	Does the project add new wastewater collection/new water mains or a new wastewater treatment system/water treatment plant? Note: A new infrastructure project adds wastewater collection/water mains or a wastewater treatment/water treatment plant where none existed previously	□ Yes	☑ No
2B.	Will the project result in either:	□ Yes	🗹 No
	An increase of the State Pollutant Discharge Elimination System (SPDES) permitted flow capacity for an existing treatment system;		

An increase such that a Department of Environmental Conservation (DEC) water withdrawal permit will need to be obtained or modified, or result in the Department of Health (DOH) approving an increase in the capacity of the water treatment plant?

Note: An expanded infrastructure project results in an increase of the SPDES permitted flow capacity for the wastewater treatment system, or an increase of the permitted water withdrawal or the permitted flow capacity for the water treatment system.

¹ If project construction is complete and the project was not previously financed through EFC, an authorized municipal representative may complete and sign this assessment.

IF THE ANSWER IS "NO" TO BOTH "2A" and "2B" ON THE PREVIOUS PAGE, THE PROJECT IS NOT SUBJECT TO FURTHER SMART GROWTH REVIEW. SKIP TO SIGNATURE BLOCK.

3. Court or Administrative Consent Orders

3A. Is the project expressly required by a court or administrative consent order?	□ Yes	□ No
3B. If so, have you previously submitted the order to EFC or DOH? If not, please attach.	□ Yes	□ No

Section 2 – Additional Information Needed for Relevant Smart Growth Criteria

EFC has determined that the following smart growth criteria are relevant for EFC-funded projects and that projects must meet each of these criteria to the extent practicable:

1. Uses or Improves Existing Infrastructure

1A. Does the project use or improve existing infrastructure? □ Yes □ No Please describe:

2. Serves a Municipal Center

Projects must serve an area in either 2A, 2B or 2C to the extent practicable.

2A. Does the project serve an area **limited** to one or more of the following municipal centers?

i. A City or incorporated Village	□Yes	□No
ii. A central business district	□Yes	□No
iii. A main street	□Yes	□No
iv. A downtown area	□Yes	□No
 v. A Brownfield Opportunity Area (for more information, go to <u>www.dos.ny.gov</u> & search "Brownfield") 	□Yes	□No
vi. A downtown area of a Local Waterfront Revitalization Program Area (for more information, go to <u>www.dos.ny.gov</u> and search "Waterfront Revitalization")	□Yes	□No
vii. An area of transit-oriented development	□Yes	□No
viii. An Environmental Justice Area (for more information, go to <u>www.dec.ny.gov/public/899.html</u>)	□Yes	□No
ix. A Hardship/Poverty Area Note: Projects that primarily serve census tracts and block numbering areas with a poverty rate of at least twenty percent according to the latest census data	□Yes	□No

Please describe all selections:

2B. If the project serves an area located outside of a municipal center, does it serve an area located adjacent to a municipal center which has clearly defined borders, designated for concentrated development in a municipal or regional comprehensive plan and exhibit strong land use, transportation, infrastructure and economic connections to an existing municipal center?

Please describe:

2C. If the project is not located in a municipal center as defined above, is the area designated by a comprehensive plan and identified in zoning ordinance as a future municipal center?

Please describe and reference applicable plans:

3. Resiliency Criteria

3A. Was there consideration of future physical climate risk due to sea-level rise, storm surge, and/or flooding during the planning of this project? □Yes □No

Please describe:

Signature Block: By entering your name in the box below, you agree that you are authorized to act on behalf of the applicant and that the information contained in this Smart Growth Assessment is true, correct and complete to the best of your knowledge and belief.
